Z User Workshop, York 1991 J. E. Nicholls, 2012-12-06 In ordinary mathematics an equation can be written down which is syntactically correct but for which no solution exists For example consider the equation $x \times 1$ defined over the real numbers there is no value of x which satisfies it Similarly it is possible to specify objects

using the formal specification language Z [3, 4] which can not possibly exist. Such specifications are called inconsistent and can arise in a number of ways. Example 1 The following Z specification of a function f from integers to integers $f: \mathbb{Z} \rightarrow \mathbb{Z}$ is inconsistent because axiom i gives $f(0) = 1$ while axiom ii gives $f(0) = 2$. This contradicts the fact that f was declared as a function that is f must have a unique result when applied to an argument. Hence no such f exists. Furthermore, $\text{iff } 0 = 1 \text{ and } f(0) = 2 \text{ then } 1 = 2$ can be deduced. From $1 = 2$ anything can be deduced thus showing the danger of an inconsistent specification. Note that all examples and proofs start with the word Example or Proof and end with the symbol $\square$.
