CVD Polymers Karen K. Gleason, 2015-06-08 The method of CVD chemical vapor deposition is a versatile technique to fabricate high quality thin films and structured surfaces in the nanometer regime from the vapor phase Already widely used for the deposition of inorganic materials in the semiconductor industry CVD has become the method of choice in many applications to process polymers as well This highly scalable technique allows for synthesizing high purity defect free films and for systematically tuning their chemical mechanical and physical properties In addition vapor phase processing is critical for the deposition of insoluble materials including fluoropolymers electrically conductive polymers and highly crosslinked organic networks Furthermore CVD enables the coating of substrates which would otherwise dissolve or swell upon exposure to solvents The scope of the book encompasses CVD polymerization processes which directly translate the chemical mechanisms of traditional polymer synthesis and organic synthesis in homogeneous liquids into heterogeneous processes for the modification of solid surfaces The book is structured into four parts complemented by an introductory overview of the diverse process strategies for CVD of polymeric materials The first part on the fundamentals of CVD polymers is followed by a detailed coverage of the materials chemistry of CVD polymers including the main synthesis mechanisms and the resultant classes of materials The third part focuses on the applications of these materials such as membrane modification and device fabrication The final part discusses the potential for scale up and commercialization of CVD polymers
