Smoking And Reproduction:

Smoking and Reproductive Health Michael J. Rosenberg, 1987 **Smoking and Reproduction** Ernest L. Abel, 1982-12-20 Product information not available **Epidemiology of Human Reproduction** Bengt Kallen, 1988-09-30

This comprehensive overview covering the field of reproductive epidemiology examines the impact of environmental factors related to embryonic and fetal development. Innovative techniques are highlighted illustrating special problems related to reproductive epidemiology. Specific environmental risks are addressed separately concluding with a chapter on risk assessment and information problems. Throughout the text is supported with over 70 illustrations of new findings never before published. This is an invaluable resource for scientists in the field of reproductive epidemiology. Male Reproduction and Oxidative Stress, volume II Shun Bai, Asim Ali, Weibin Bai, 2025-10-30

Given the success of Research Topic Male Reproduction and Oxidative Stress and the rapidly evolving subject area we are pleased to announce the launch of Volume II. Infertility is defined as the failure to conceive with regular sexual intercourse after at least 1 year. Collectively primary infertility inability to conceive after one year and secondary infertility infertility for one year after having conceived at least once before affect 10% 15% of couples globally and male factors contribute to approximately 50% of cases. Both extrinsic factors age weight body composition heat exposure smoking drinking environmental pollutant exposure medical interventions and chemotherapeutic exposure and intrinsic factors cell apoptosis varicocele metabolic syndrome inflammation and male gland infection could induce oxidative stress OS which can lead to poor semen quality and male factor infertility. Poor lifestyles including heavy drinking and smoking increased BMI and exposure to air toxics are all associated with increased cellular OS which can result in increased production of reactive oxygen species ROS. In addition to lifestyles the level of sperm ROS also increases with age. High levels of sperm ROS cause abnormal semen parameters in particular sperm concentration motility and DNA fragmentation. Accordingly cellular OS should be considered in the routine clinical application of male infertility. Anthocyanins which belong to one of the six subgroups of flavonoids have high antioxidant properties and may be positively associated with semen quality and male fertility. Considering the emerging importance of intracellular ROS homeostasis in the development of gametes anthocyanins have been studied in reproductive development owing to the high sensitivity of anthocyanins to oxidative stress. Until now several anthocyanins in fruits and other plant derived foods can confer protection in spermatogenesis disorders caused by reproductive toxic compounds implying the importance of the antioxidants in maintaining normal testicular function and male fertility. This Research Topic aims to provide an up to date understanding of the intrinsic and extrinsic factors that are associated with oxidative stress in male reproduction. We welcome submissions of Original Research Reviews and Case Report on the following sub topics including but not limited to Oxidative stress and sperm function e.g. sperm DNA fragmentation mitochondrial membrane potential MMP ROS Oxidative stress and sexual dysfunction The role of lifestyle factors and environmental pollutants in male infertility The

impact of nutrients and antioxidants on male fertility The association of oxidative stress in metabolic syndrome related male infertility Role of oxidative stress in varicocele and male gland infection Inflammatory and male reproduction *Analyzing Male Reproductive Risk, Understanding Molecular Targets, and Developing Treatments* Xiang Xiao, Cibeles S. Borges, Huitao Li, C. Yan Cheng, 2024-07-10 Male fertility both resilient and fragile is heavily affected by external factors such as the environment drug use and eating habits in a similar way to a wall of stone that is constantly attacked and weathered to varying degrees The use of cancer drugs for instance may increase life expectancy and cure diseases but may also negatively affect male fertility A variety of factors complicate male infertility such as the intricate spermatogenesis process The available methods for diagnosis are limited not to mention treatment However some evidence showed that different reproductive physiologies may share some biological basis and thus molecular pathways such as mTOR which plays a role in testis physiology Sertoli cell function transcriptional and translational control of spermatogenesis as well as drug and environmental exposure Moreover male fertility can also reflect men's overall health and the likelihood of suffering from certain diseases suggesting that these events have common regulatory mechanisms This Research Topic aims to identify these potential shared mechanisms analyze and explore how environment disease drug use and nutritional supplements affect male fertility as well as reveal the seemingly chaotic but traceable phenomena It will be crucial for the development of diagnostics treatments and maintenance methods needed to enhance male fertility which is also the objective of this research topic This Research Topic encourages Original Research Reviews and other accepted article types including but not limited to Analyses of the possible effects of environmental pollutants brought about by industry and human activities such as endocrine disrupting chemicals EDCs on male reproduction Links between men's overall health and fertility as well as andrological effects of various illnesses including infectious diseases deficiencies hereditary diseases and physiological disorders Effects of medications and dietary supplements on male reproductive systems such as those used for cancer treatment psychiatric disorders diabetes etc The use of herbal and medicinal remedies to prevent or reverse adverse andrological effects caused by putative toxic chemicals and diseases Specific molecular mechanisms and signalling pathways that affect spermatogenesis the testis and sperm function associated with the above 4 points Shared molecular mechanisms underlying both the generation and remission of male infertility disease *Reproductive and Developmental Toxicology* Ramesh C Gupta, 2011-04-04 Reproductive toxicology is a complex subject dealing with three components parent placenta and fetus and the continuous changes that occur in each Reproductive and Developmental Toxicology is a comprehensive and authoritative resource providing the latest literature enriched with relevant references describing every aspect of this area of science It addresses a broad range of topics including nanoparticles and radiation gases and solvents smoking alcohol and drugs of abuse food additives nutraceuticals and pharmaceuticals and metals among others With a special focus on placental toxicity this book is the only available reference to connect the three key risk stages and is the only resource to include

reproductive and developmental toxicity in domestic animals fish and wildlife Provides a complete integrated source of information on the key risk stages during reproduction and development Includes coverage of emerging science such as stem cell application toxicoproteomics metabolomics phthalates infertility teratogenicity endocrine disruption surveillance and regulatory considerations and risk assessment Offers diverse and unique in vitro and in vivo toxicity models for reproductive and developmental toxicity testing in a user friendly format that assists in comparative analysis **Environment and**

Female Reproductive Health Huidong Zhang,Jie Yan,2021-02-01 This book will focus on the harmful effect of environmental toxins on female reproductive health Reproduction is the basis of the continuation of human beings and environment is the basis of human survival However environmental pollution has become a potential risk factor for human reproductive health which not only leads to many chronic diseases but also causes certain harm to reproductive health Compared to male reproduction female reproductive process is more complex the reproductive system is more fragile and is more vulnerable to be damaged The aim of this book is to review the research progress to address the challenges and to stimulate the development in the direction of environment and female reproductive health *Health effects of exposure to*

United States. Public Health Service. Office of the Surgeon General,2010 This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke Many Surgeon General s reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies Mechanisms of disease are important because they may provide plausibility which is one of the guideline criteria for assessing evidence on causation This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke This evidence is relevant to understanding how smoking

causes disease to identifying those who may be particularly susceptible and to assessing the potential risks of tobacco products
