Gurunatha, 2012 Every manufacturing or systems engineer has grappled with questions like these How can we reduce the cost of testing our process or product How do we know if our development process is robust Where do the gaps lie in our manufacturing or testing process How do we build a reliable robust process that all stakeholders can count on Around these questions has risen a veritable industry of solutions manufacturing standards statistical methods and more And yet designing

for reliability remains a little understood and much feared proposition Now design phase gate review and testing expert and veteran technical problem solver Thim Gurunatha brings to his readers a lifetime of experience in designing robust and reliable processes In his new book Systems Engineering Standards The State of the Art Thim systematically tackles fundamental and esoteric problems that plague manufacturing and systems engineers today Thim understands that while modern technologies including computing technologies have greatly aided today s engineers they have also revealed gaps cracks and chinks which were not apparent before With this new book Thim s mission is to close all the little gaps towards developing perfect processes Coming in to fill a critical void Thim s new book teaches engineers to make the process of statistical process control SPC more efficient Even the most seasoned engineers will learn how to make the design of experiments less expensive reduce testing time and increase the accuracy of reliability predictions The author lucidly articulates that the survival of companies in future may depend on the implementation of breakthrough strategies in problem solving In such an environment understanding and promoting the use of statistical tools becomes a management issue rather than an operator problem Used effectively statistical methods greatly reduce problem solving time Because of the abundance of statistical tools however it is important to know which tools to use when and which tools not to use Thim s direct to action book helps systems engineers pick the best of the best tools for each application and assists its users in applying these tools saving them millions of dollars Surely readers can recession proof their careers with the wisdom in this brand new book

Optimizing the Decision Rule of a GPS Integrity Monitoring System for Improved Availability Michael Stephen Koenig, 2010 The Global Positioning System which was created by the United States Department of Defense specifically for guiding munitions has disseminated into many applications of the present Using a differential ground based augmentation scheme has enabled GPS guidance to be used for the ultra safety requisite use of landing aircraft The civil incarnation of this project is called LAAS for Local Area Augmentation System The military desired a comparable system for their use and has instituted the JPALS program for Joint Precision and Approach Landing System The object is to deliver an integrity monitor to satisfy the stringent requirements of difficult military operation Although the distinction of emphasis might seem to be on the inherent danger of physical conflict since the landing platform is expected to be distant from any combat it is actually the electro magnetic conflict which takes precedence in this thesis The JPALS land based or sea based Integrity Monitor must be designed to endure radio frequency interference RFI The potential of RFI to undermine the operation of a landing system is quite real The intrinsic obligation of an Integrity Monitoring System is to bound the errors associated with the guidance being provided To this end the system must determine if any of measurements are faulty and if those faults indicate the presence of a potentially hazardous position error Hardware and software can be used to mitigate the impact of radio frequency interference to a GPS based landing system Beam steering antennas can be used to emphasize the satellites signals and to simultaneously deemphasize a jamming source The focus of this thesis is in the software algorithms How can we enhance the performance of our system in its robustness to interference by optimizing the decision rule it uses to exclude satellites and receivers thereby maximizing the amount of useable information and minimizing the error limits that are broadcast to the approaching aircraft
