Analysis of Subsynchronous Resonance in Power Systems Wenchun Zhu, 1994 Three aspects of Subsynchronous Resonance SSR related problems in power systems are addressed in this dissertation which aims at contributing to a better understanding of these problems Subsynchronous Resonance SSR problems in series compensated steam turbine power systems co exist with the beneficial effects provided by the series capacitors Since the early 1930s numerous researchers have addressed issues relating to these problems The development of a generalized frequency scan method for analyzing SSR in a Single Machine Infinite Bus SMIB power system equipped with fixed series capacitor compensation is presented This method overcomes shortcomings present in the traditional frequency scan technique which is widely used in power system analysis It has been noticed that there are nonlinear dynamic phenomena in power systems which can not be explained by linear system theory This includes limited oscillations in a power system when it experiences SSR at a frequency

close to one of the system modes The phenomenon can be explained by Hopf bifurcations This dissertation presents an analysis for a high dimensional model of a SMIB power system equipped with fixed series capacitor compensation The results obtained can lead to a more precise understanding of this phenomenon than those available to date which use perturbation methods and highly simplified second order power system models Compared with fixed series capacitor compensation in power systems the newly developed Thyristor Controlled Series Compensation TCSC scheme has some well known advantages with regard to flexible power system control It has been noted that vernier mode TCSC operation can provide for SSR mitigation In this thesis such beneficial effect is demonstrated and analyzed for a simplified North Western American Power System NWAPS model based on EMTP simulations Issues relating to modelling and simulation of power system and TCSC are addressed

Subsynchronous Resonance in Power Systems Robert Allen Blessin, 1976 Risk Based Assessment of Subsynchronous Resonance in AC/DC Systems Atia Adrees, 2016-10-04 This relevant and timely thesis presents the pioneering use of risk based assessment tools to analyse the interaction between electrical and mechanical systems in mixed AC DC power networks at subsynchronous frequencies It also discusses assessing the effect of uncertainties in the mechanical parameters of a turbine generator on SSR in a meshed network with both symmetrical and asymmetrical compensation systems The research presented has resulted in 12 publications including three top international journal papers IEEE Transactions on Power Systems and nine international conference publications including two award winning papers
