Cardiovascular Specific Gene Expression P.A.F.M. Doevendans, Robert S. Reneman, Marc van Bilsen, 2013-04-17 Improving our insights into the genetic predisposition to cardiovascular disease is one of the most important challenges in our field in the next millennium not only to unravel the cause of disease but also to improve the selection of patients for particular treatments Nowadays for example subjects with a cholesterol above a particular plasma level are exposed to a cholesterol lowering regime based upon the beneficial outcome of epidemiological studies which include subjects not prone to the disease despite a plasma cholesterol above the accepted level Identification of the patients who are genetically predisposed to the consequences of this disorder will reduce the number of subjects unnecessarily treated and hence the costs of health care Because in most

cardiovascular diseases the genetic component is a consequence of more than one gene defect only limited progress has as yet been made in identifying subjects genetically at risk For example in hypertension only in less than 10% of the patients the genetic defect has been identified It has been known for quite some time that in heart and blood vessels fetal genes are as high blood pressure and upregulated or induced when they are exposed to such disorders ischemia Little is known about the function of these genes in the cardiac and vascular adaptation to these disorders only guesses can be made

Studies on Cardiovascular Disorders Heinrich Sauer, Ajay M. Shah, Francisco R. M. Laurindo, 2010-09-11 This collection of articles on oxidative stress in clinical practice surveys essential current research in what is a rapidly evolving field As well as giving the reader a mechanistic overview of how oxidative stress affects cardiovascular disease it analyzes the potential of a number of therapeutic options that target these pathways Understanding the complexity of the cellular redox system could lead to the development of better targeted interventions that facilitate patient recovery Even as large scale clinical trials of so called simple antioxidant approaches such as vitamins C and E show that significant benefits for cardiovascular patients remain elusive *Studies on Cardiovascular Disorders* demonstrates that such approaches are too simplistic Beginning with a summary of redox signaling models that could induce the progression of redox associated cardiovascular disorders the volume moves on to examine redox mediated protein modification under physiological and

pathophysiological conditions It provides an outline of the signaling pathways in cardiovascular development during embryogenesis and what impact these might have in the differentiation process of resident cardiac and blastocyst derived stem cells Further chapters detail our current knowledge of the influence the sensory nervous system exerts on the cardiovascular system and the paradoxical role of mitochondria derived ROS in cardiac protection In all almost 30 contributions cover issues as diverse as the antioxidant properties of statins in the heart and the oxidative risk factors for cardiovascular disease in women A range of medical practitioners will find the contents of Studies on Cardiovascular Disorders provides illuminating insight into the Janus faced role of ROS in the cardiovascular system
