*The Haskell Road to Logic, Maths and Programming. Second Edition* Kees Doets, Van Jan Eijck, 2004-05 Long ago when Alexander the Great asked the mathematician Menaechmus for a crash course in geometry he got the famous reply There is no royal road to mathematics Where there was no shortcut for Alexander there is no shortcut for us Still the fact that we have access to computers and mature programming languages means that there are avenues for us that were denied to the kings and emperors of yore The purpose of this book is to teach logic and mathematical reasoning in practice and to connect logical reasoning with computer programming in Haskell Haskell emerged in the 1990s as a standard for lazy functional programming a programming style where arguments are evaluated only when the value is actually needed Haskell is a marvelous demonstration tool for logic and maths because its functional character allows implementations to remain very close to the concepts that get implemented while the laziness permits smooth handling of infinite data structures This book does not assume the reader to have previous experience with either programming or construction of formal proofs but acquaintance with mathematical notation at the level of secondary school mathematics is presumed Everything one needs to know about mathematical reasoning or programming is explained as we go along After proper digestion of the material in this book the reader will be able to write interesting programs reason about their correctness and document them in a clear fashion The reader will also have learned how to set up mathematical proofs in a structured way and how to read and digest mathematical proofs written by others This is the updated expanded and corrected second edition of a much acclaimed textbook Praise for the first edition Doets and van Eijck s *The Haskell Road to Logic Maths and Programming* is an astonishingly extensive and accessible textbook on logic maths and Haskell Ralf Laemmel Professor of Computer Science University of Koblenz Landau

this book the reader will be able to write interesting programs reason about their correctness and document them in a clear fashion The reader will also have learned how to set up mathematical proofs in a structured way and how to read and digest mathematical proofs written by others This is the updated expanded and corrected second edition of a much acclaimed textbook Praise for the first edition Doets and van Eijck s The Haskell Road to Logic Maths and Programming is an astonishingly extensive and accessible textbook on logic maths and Haskell Ralf Laemmel Professor of Computer Science University of Koblenz Landau

Against Metaphysical Necessity Manuel Bremer, 2025-02-10 One should not commit to

metaphysical necessity semantic modalities are enough The best approaches to elucidate semantic modalities are versions of linguistic ersatzism and fictionalism even if only developed in parts Within these necessary properties and the difference between natural and semantic laws can be accounted for The proper background theory for this is an updated version of Logical Empiricism The anti metaphysical attitude of Logical Empiricism deserves revitalization The second part of the book illustrates a methodological observation from the first part elucidating a concept can proceed by computational modelling As an example the book concerns modelling belief dynamics in the sense of building a computational model The purpose is to illustrate some ideas about belief changes in a web of beliefs to explore and deepen one's understanding of belief changes by implementing corresponding algorithms As a part of the model accepting conditionals and counterfactuals can be understood by versions of Ramsey Tests i.e. again without modal commitments

**Функциональное программирование на языке Haskell** Роман Душкин, 2022-01-29 Haskell *Proof-theoretical Coherence* Kosta Došen, Zoran Petrić, 2004 This book in categorial proof theory formulates in terms of category theory a generalization close to linear algebra of the notions of distributive lattice and Boolean algebra These notions of distributive lattice category and Boolean category codify a plausible nontrivial notion of identity of proofs in classical propositional logic which is in accordance with Gentzen's cut elimination procedure for multiple conclusion sequents modified by admitting new principles called union of proofs and zero proofs It is proved that these notions of category are coherent in the sense that there is a faithful structure preserving functor from freely generated distributive lattice categories and Boolean categories into the category whose arrows are relations between finite ordinals a category related to generality of proofs and to the notion of natural transformation These coherence results yield a simple decision procedure for equality of proofs Coherence in the same sense is also proved for various more general notions of category that enter into the notions of distributive lattice category and Boolean category Some of these coherence results like those for monoidal and symmetric monoidal categories are well known but are here presented in a new light The key to this categorification of the proof theory of classical propositional logic is distribution of conjunction over disjunction that is not an isomorphism as in cartesian closed categories
