

Some Solved and Unsolved Problems of Mine in Number Theory

Paul Erdős

I.

Let $p_1 < p_2 < \dots$ be the sequence of consecutive primes. Put $p_{n+1} - p_n = d_n$. It is well known that the sequence d_n behaves very irregularly. An old result of Ricci and myself states that the set of limit points of $d_n/\log n$ has positive measure. "It is of course clear to every right thinking person" that the set $d_n/\log n$ is dense in $(0, \infty)$, but we are very far from being able to prove this ("we" here stands for the collective intelligence (or rather stupidity) of the human race). By a result of Westzynthius, ∞ is a limit point of $d_n/\log n$ but no other limit point is known.

Turan and I easily proved that both inequalities $d_n > d_{n+1}$ and $d_n < d_{n+1}$ have infinitely many solutions; we noticed with some annoyance and disappointment that we could not prove that $d_n > d_{n+1} > d_{n+2}$ has infinitely many solutions. We were even more annoyed when we soon noticed that we could not even prove that either $d_n > d_{n+1} > d_{n+2}$ or $d_n < d_{n+1} < d_{n+2}$ has infinitely many solutions. In other words we could not prove that for every n , $(-1)^i(d_{n+i+1} - d_{n+1})$ must have infinitely many changes of sign. I offer 250 dollars for a proof of this conjecture (and 25,000 for a disproof).

Put $f(n) = \log n \log \log n \log \log \log n / (\log \log \log n)^2$. Rankin proved in 1938 that

$$(1) \quad \limsup \left(\frac{d_n}{f(n)} \right) > 0 .$$

I offered 10,000 dollars for a proof of

$$(2) \quad \limsup \left(\frac{d_n}{f(n)} \right) = \infty .$$

This book takes the reader on a mathematical journey from a number theoretic point of view to the realm of Markov's theorem and the uniqueness conjecture gradually unfolding many beautiful connections until everything falls into place in the proof of Markov's theorem What makes the Markov theme so attractive is that it appears in an astounding variety of different fields from number theory to combinatorics from classical groups and geometry to the world of graphs and words On the way there are also introductory forays into some fascinating topics that do not belong to the standard curriculum such as Farey fractions modular and free groups hyperbolic planes and algebraic words The book closes with a discussion of the current

state of knowledge about the uniqueness conjecture which remains an open challenge to this day All the material should be accessible to upper level undergraduates with some background in number theory and anything beyond this level is fully explained in the text This is not a monograph in the usual sense concentrating on a specific topic Instead it narrates in five parts Numbers Trees Groups Words Finale the story of a discovery in one field and its many manifestations in others as a tribute to a great mathematical achievement and as an intellectual pleasure contemplating the marvellous unity of all mathematics

Inverse and Algebraic Quantum Scattering Theory Barnabas Apagyi,Gabor Endredi,Peter Levay,2013-12-30 This volume contains three interrelated beautiful and useful topics of quantum scattering theory inverse scattering theory algebraic scattering theory and supersymmetrical quantum mechanics The contributions cover such issues as coupled channel inversions at fixed energy inversion of pion nucleon scattering cross sections into potentials inversions in neutron and x ray reflection 3 dimensional fixed energy inversion inversion of electron scattering data affected by dipole polarization nucleon nucleon potentials by inversion versus meson exchange theory potential reversal and reflectionless impurities in periodic structures quantum design in spectral scattering and decay control solution hierarchy of Toda lattices etc
