Image, Language, Brain Alec Marantz, Yasushi Miyashita, Wayne O'Neil, Wayne A. O'Neil, 2000. The papers in this volume discuss the current status of the cognitive neuroscience synthesis in research on vision, whether and how linguistics and neuroscience can be integrated and how integrative brain mechanisms can be studied through the use of noninvasive brain imaging techniques. Recent attempts to unify linguistic theory and brain science have grown out of recognition that a proper understanding of language in the brain must reflect the steady advances in linguistic theory of the last forty years. The first Mind Articulation Project Symposium addressed two main questions: How can the understanding of language from linguistic research be transformed through the study of the biological basis of language? And how can our understanding of the brain be transformed through this same research? The best model so far of such mutual constraint is research on vision. Indeed, the two long term goals of the Project are to make linguistics and brain science mutually constraining in the way that has been attempted in the study of the visual system and to formulate a cognitive theory that more strongly constrains visual neuroscience. The papers in this volume discuss the current status of the cognitive neuroscience synthesis in research on vision, whether and how linguistics and neuroscience can be integrated and how integrative brain mechanisms can be studied through the use of noninvasive brain imaging techniques. How the Brain Got Language, Unlike any other species, humans can learn and use language. This book explains how the brain evolved to make language possible through what Michael Arbib calls the Mirror System Hypothesis. Because of mirror neurons, monkeys, chimps and humans can learn by imitation, but only complex imitation which humans exhibit is powerful enough to support the breakthrough to language. This theory provides a path from the openness of manual gesture which we share with

nonhuman primates through the complex imitation of manual skills pantomime protosign communication based on conventionalized manual gestures and finally to protospeech The theory explains why we humans are as capable of learning sign languages as we are of learning to speak This fascinating book shows how cultural evolution took over from biological evolution for the transition from protolanguage to fully fledged languages The author explains how the brain mechanisms that made the original emergence of languages possible perhaps 100 000 years ago are still operative today in the way children acquire language in the way that new sign languages have emerged in recent decades and in the historical processes of language change on a time scale from decades to centuries Though the subject is complex this book is highly readable providing all the necessary background in primatology neuroscience and linguistics to make the book accessible to a general audience
