Skin Carcinogenesis in Man and in Experimental Models Erich Hecker, E.G. Jung, F. Marks, W. Tilgen, 2012-12-06 The detection of cancer risk factors and their possible avoid ance would most effectively contribute to the fight against cancer Research in these areas depends to a substantial degree on in vivo experimental animal models and on epide miologic studies including data from cancer registries When the Deutsches Krebsforschungszentrum was founded in 1964 its division Mechanisms of Tumorigenesis and a number of other divisions became engaged in research on chemical carcinogenesis of the skin mainly using the mouse skin as an experimental model Their interest orig inated in part from investigations of the new and at that time controversial pathogenic principle of conditional car cinogens as represented by certain tumor promoters which are per se noncarcinogenic During the past 25 years conditional carcinogens in terms of tumor promoters were established as anew nonclassical category of cancer risk factors besides the classical solitary carcinogens In the course of this exciting period scientists of our center started cooperative programs with clinical dermato logists of the University of Heidelberg at the Clinics of Dermatology in Heidelberg and Mannheim to extend the scope of their investigations into clinical oncology and to contribute by experimental approaches to solving problems in clinical oncology This led to a gradual shift from mere animal studies to the more direct analyses of human tumors and opened up for us a new phase of research

Environmental Health Perspectives ,1993 Chemical Carcinogenesis Trevor M. Penning,2011-03-03 This volume will provide a contemporary account of advances in chemical carcinogenesis It will promote the view that it is chemical alteration of the DNA that is a route cause of many cancers The multi stage model of chemical carcinogenesis exposure to major classes of human carcinogens and their mode of action will be a focal point The balance between metabolic activation to form biological reactive intermediates and their detoxification ensuing DNA lesions and their repair will be profiled It will describe the chemical changes that occur in DNA that result from endogenous insults including epigenetic changes that lead to gene silencing It will describe major mechanisms of mutagenesis affects on tumor suppressor genes and proto oncogenes and how cell cycle check points can be by passed by the stealth like properties of chemical carcinogens Environmental agents that can promote tumor formation will be discussed The monograph will have wide appeal as a knowledge base for graduate students post doctoral fellows and faculty interested in this aspect of cancer causation and research

Carcinogenesis Michael P Waalkes, Jerrold M. Ward, 1994-06-30 Carcinogens like chemicals with other toxic hazards often produce adverse effects only in specific organs or tissues The factors determining whether a chemical induces cancer in an organ range from simple toxicokinetics to complex phenomena such as expression or lack of expression of specific genes This volume examines the site specific factor Initiation and Promotion in Skin Or Liver Neoplasia Edward B. Ilgren, 2024-12-06 Initiation and Promotion in Skin or Liver Neoplasia is the only source of its kind that presents a comprehensive compilation of in vivo initiation promotion studies that involve neoplastic changes in the skin or liver of

experimental animals The book surveys world literature over the past 65 years from almost 2 000 original studies covering nearly 200 journals in 9 languages Publications reviewed consist of primary peer reviewed papers as well as those abstracts meeting reports and review articles containing original data Papers measuring both pre neoplastic or neoplastic changes are included The summaries for each study included in the book are highly formatted resumes that have four principal components which indicate 1 What was done in the study 2 How the study was done e q methods 3 The precise results obtained 4 Individual critiques using GLP Good Lab Practice standards Initiation and Promotion in Skin or Liver Neoplasia provides an indispensable abstracted reference resource for scientists toxicologists cancer researchers litigators regulators environmentalists policy analysts and industry based investigators Biochemical and Molecular Aspects of Selected Cancers Thomas G. Pretlow II,2013-10-22 This two volume work not only includes much of the newer molecular biology research but also important earlier research in this area essential for the comprehensive understanding of the biochemistry of neoplastic diseases As such it will provide an invaluable source of information for the young investigator Human cancers not experimental models of cancer are emphasized <u>Chemical Induction of Cancer Joseph C. Arcos, Mary F. Argus, Yin-tak</u> Woo, 2012-12-06 In the approach to the analysis of disease including of course cancer two major thrusts may be distinguished These may be referred to in shorthand as agents and processes the causative agents chemical microbial physical environmental and psychosocial and the organismic processes initiated and furthered by the agents culminating in observable pathology at the macromolecular cytological histological organ function locomotor and behavioral levels The past 25 years since the appearance of the first volume of the predecessor series 1 authored by the Editors of this present volume have seen an impressive number of studies on chemicals and other agents as etiologic factors in the induction of cancer The major emphasis has been on the discovery of many chemical carcinogens of widely different structures their metabolism by various tissues and cells and in turn their molecular biochemical effects on the cells This rapidly expanded body of information as effectively covered in the predecessor volumes is an excellent entree to the second half of the overall problem of chemical carcinogenesis the processes The active agents trigger a large array of molecular biochemical alterations to which the target cells target tissues and target organisms respond in many select and common ways This second major aspect of the induction of cancer by chemicals and by other agents the sequence of cellular and tissue changes clearly relevant to cancer remains the challenge for the future **Journal of the National Cancer Institute**, 1999 Each issue is packed with extensive news about important cancer related science policy politics and people Plus there are editorials and reviews by experts in the field book reviews and commentary on timely topics **Protein Phosphorylation** Friedrich Marks, 2008-09-26 Protein phosphorylation is a key mechanism in cellular signaling This volume presents a state of the art survey of one of the most rapidly developing fields of biochemical research Written by leading experts it presents the latest results for some of the most important cellular pathways Color plates illustrate structural or functional relationships
