The papers in this volume were presented at an international symposium on Topics in Surface Chemistry which was held in Bad Neuenahr West Germany September 7 9 1977 The symposium was sponsored by IBM Germany It has been recognized for many years that our understanding of bulk phenomena and their subsequent exploitation depends largely on our ability to define correlations between microscopic structure and the physical and chemical phenomena of interest The role played by surface phenomena in the overall behavior of a material has been a subject for speculation for a long time but only during the last decade or so have experimental and theoretical tools been developed which make it possible to investigate surface structure and related surface phenomena uniquely Numerous surface spectroscopies have been developed in recent years intended to describe the geometric vibrational and electronic structure of a surface Our present understanding of surface thin film and interfacial phenomena in solid state physics owes much to these developments In chemistry much of the interest in surface science has come from the obvious implications to such important and diverse fields as catalysis and corrosion It takes little imagination to recognize that there are many other areas where advances in surface science can be brought to bear      *Advances in Digital Image Processing* P. Stucki,2013-11-11 Digital image processing originally established to analyze and improve lunar images is rapidly growing into a wealth of new applications due to the enormous technical progress made in computer engineering At present the most important fields of growth appear to emerge in the areas of medical image processing i.e. tomography thermography earth resource inventory i.e. land usage minerals office automation i.e. document storage retrieval and reproduction and industrial production i.e. computer vision for mechanical robots Currently emphasis is being shifted from signal processing research and design innovation activities towards cost efficient system implementations for interactive digital image processing For the years ahead trends in computer engineering indicate still further advances in Large Scale Integration LSI and Input Output I/O technologies allowing the implementation of powerful parallel and or distributed processor architectures for real time processing of high resolution achromatic and color images In view of the many new developments in the field of digital image processing and recognizing the importance of discussing these developments amongst key scientists that might make use of them ffiM Germany sponsored an international symposium on Advances in Digital Image Processing held at Bad Neuenahr Federal Republic of Germany September 26 28 1978 The interest shown in this symposium encouraged the publication of the papers presented in this volume of the ffiM Research Symposium Series      The Publishers' Trade List Annual ,1977      **Stiff Differential Equations** Ralph A. *Microelectronic Technology* Joachim Bargon, 2013-03-09 The papers collected in this volume were presented at the International Symposium on Methods and Materials in Microelectronic Technology This symposium was sponsored by IBM Germany and it was held September 29 October 1 1982 in Bad Neuenahr West Germany The progress of semiconductor and microelectronic technology has become so rapid and the field so sophisticated that it is imperative to exchange the latest insight gained as frequently as it can be accomplished In addition it is peculiar for this field that the bulk of the investigations are carried out at industrial research and development laboratories which makes some of the results less readily accessible Because of these circumstances the academic community which among other things is supposed to communicate the progress in this field to students of different disciplines finds it rather difficult to stay properly informed It was the intent of this IBM sponsored symposium to bring together key scientists from academic institutions primarily from Europe with principal investigators of the industrial scene Accordingly this symposium exposed technologists to scientists and vice versa Scientific advances often lead directly to technological innovations In turn new technologies are often arrived at empirically and because of that are initially poorly understood Scientific inquiry then attempts to probe these processes and phenomena in order to achieve a better understanding Thus science and technology are intricately interconnected and it is important that technical exchange between technologists and scientists is facilitated since the problems are typically interdisciplinary in nature

*Optimal Estimation in Approximation Theory* Charles Michelli, 2013-11-22 The papers in this volume were presented at an International Symposium on Optimal Estimation in Approximation Theory which was held in Freudenstadt Federal Republic of Germany September 27 29 1976 The symposium was sponsored by the IBM World Trade Europe Middle East Africa Corporation Paris and IBM Germany On behalf of all the participants we wish to express our appreciation to the sponsors for their generous support In the past few years the quantification of the notion of complexity for various important computational procedures e g multiplication of numbers or matrices has been widely studied Some such concepts are necessary ingredients in the quest for optimal or nearly optimal algorithms The purpose of this symposium was to present recent results of similar character in the field or approximation theory as well as to describe the algorithms currently being used in important areas of application of approximation theory such as crystallography data transmission systems cartography reconstruction from x rays planning of radiation treatment optical perception analysis of decay processes and inertial navigation system control It was the hope of the organizers that this confrontation of theory and practice would be of benefit to both groups Whatever success the symposium had is due in no small part to the generous and wise scientific counsel of Professor Helmut Werner to whom the organizers are most grateful

*The Physics and Chemistry of Liquid Crystal Devices* Gerald J. Sprokel, 2013-11-11 Over 100 scientists met at the IBM Research Laboratory in San Jose California for a symposium on the Physics and Chemistry of Liquid Crystal Devices

The two day meeting was intellectually stimulating with excellent oral presentations and with person to person discussions. The applications of liquid crystals have developed dramatically in the past ten years. In these few years they have moved from being a laboratory curiosity to products in the market place. The first commercial application 1940 s of liquid crystals was the preparation of a light polarizer. The second commercial application was their use as temperature sensors. The third major application of liquid crystals dealt with commercial displays. Other current applications include polymeric and graphitic fibers and light attenuators. The future of liquid crystals looks very promising indeed. One can expect to see new fibers of qualities which will be superior to those presently known. Graphitic fibers or other physical forms of graphitic materials will be used as catalytic surfaces for chemical synthesis. In the display area one can expect to see television screens using liquid crystals. Larger displays than are now used in wrist watches and pocket calculators will become available. Liquid crystals using color displays will become commercially practical. Watches, calculators and television screens will have color.

**Computational Methods in Chemistry** Joachim Bargon, 2013-03-09. The papers collected in this volume were presented at an international symposium on Computational Methods in Chemistry. This symposium was sponsored by IBM Germany and was held September 17-19, 1979 in Bad Neuenahr, West Germany. According to Graham Richards, *Nature* 278:507, 1979, the Third Age of Quantum Chemistry has started where the results of quantum chemical calculations have become so accurate and reliable that they can guide the experimentalists in their search for the unknown. The particular example highlighted by Richards was the successful prediction and subsequent identification of the relative energies, transition probabilities and geometries of the lowest triplet states of acetylene. The theoretical predictions were based chiefly upon the work of three groups. Kammer, *Chern. Phys. Lett.* 529, 1970, had made qualitatively correct predictions. Demoulin, *Chern. Phys.* 11:329, 1975, had calculated the potential energy curves for the two lowest triplet states  $3\sigma_g$  and  $3\sigma_u$  of  $\text{C}_2$  acetylene. Wetmore and Schaefer III, *J. Chern. Phys.* 68:1648, 1978, had determined the geometries of the cis- $3\sigma_g$  and  $3\sigma_u$  and the trans- $3\sigma_g$  and  $3\sigma_u$  isomers of these two states. In a guided search, Wendt, Hunziker and Hippler, *J. Chern. Phys.* 70:4044, 1979, succeeded in finding the predicted near infrared absorption of the cis-triplet acetylene; no corresponding absorption for the trans form was found, which is in agreement with theory and the resolved structure of the spectrum confirmed the predicted geometries conclusively.
