Non-Gaussian Statistical Communication Theory David Middleton, 2012-05-11 The book is based on the observation that communication is the central operation of discovery in all the sciences In its active mode we use it to interrogate the physical world sending appropriate signals and receiving nature s reply In the passive mode we receive nature s signals directly Since we never know a prioriwhat particular return signal will be forthcoming we must necessarily adopt a probabilistic model of communication This has developed over the approximately seventy years since it s beginning into a Statistical Communication Theory or SCT Here it is the set or ensemble of possible results which is meaningful From this ensemble we attempt to construct in the appropriate model format based on our understanding of the observed physical data and on the associated statistical mechanism analytically represented by suitable probability measures Since its inception in the late 30 s of the last century and in particular subsequent to World War II SCT has grown into a major field of study As we have noted above SCT is applicable to all branches of science The latter itself is inherently and ultimately probabilistic at all levels Moreover in the natural world there is always a random background noise as well as an inherent a priori uncertainty in the presentation of deterministic observations i e those which are specifically obtained a posteriori The purpose of the book is to introduce Non Gaussian statistical communication theory and demonstrate how the theory improves probabilistic model The book was originally planed to include 24 chapters as seen in the table of preface Dr Middleton completed first 10 chapters prior to his passing in 2008 Bibliography which represents remaining chapters are put together by the author s close colleagues Drs Vincent Poor Leon Cohen and John Anderson email pressbooks ieee org to request Ch 10 U.S.

David R. McDonald, Stephen Robert Edward Turner, 2000 This volume consists of the proceedings of the Workshop on Analysis and Simulation of Communication Networks held at The Fields Institute Toronto The workshop was divided into two main themes entitled Stability and Load Balancing of a Network of Call Centres and Traffic and Performance The call centre industry is large and fast growing In order to provide top notch customer service it needs good mathematical models The first part of the volume focuses on probabilistic issues involved in optimizing the performance of a call centre While this was the motivating application many of the papers are also applicable to more general distributed queueing networks The second part of the volume discusses the characterization of traffic streams and how to estimate their impact on the performance of a queueing system The performance of queues under worst case traffic flows or flows with long bursts is treated These studies are motivated by questions about buffer dimensioning and call admission control in ATM or IP networks This volume will serve researchers as a comprehensive state of the art reference source on developments in this rapidly expanding field
