**Eyes in the Sky** Andrew May,2024-01-18 Over 50 years ago astronomers launched the world s first orbiting telescope to gaze further into outer space to examine anything that appears in the sky above our heads from comets and planets to galaxy clusters and stars Since then almost 100 space telescopes have been launched from Earth and are orbiting our planet with 26 still active and relaying information back to us As a result of these space based instruments such as NASA s iconic Hubble Space Telescope we know much more about the universe now than we did half a century ago But why is Hubble orbiting just 540 kilometres above the Earth so much more effective than a ground based telescope How can a glorified camera tell us not only what distant objects look like but their detailed chemical composition and three dimensional structure as well In Eyes in the Sky science writer Andrew May takes us on a journey into space to answer these questions and more by looking at the development of revolutionary instruments such as Hubble and the James Webb Space Telescope exploring how such technology has helped us understand the evolution of the Universe
