Novikov, 1985 Statistics and Control of Random Processes A. A. Novikov, Al'bert Nikolaevich Shiriaev, 1994 This book

contains papers by participants in two seminars one on martingales and statistics of stochastic processes and one on sequential analysis both of which were held at the Steklov Institute of the Russian Academy of Sciences The papers develop the concepts of martingales and semimartingales and stochastic calculus for them as well as their applications in statistics and control of stochastic processes The class of semimartingales that is the class of all processes which can be represented as a sum of a martingale and a process with bounded variation is rather large It contains such important processes as Brownian motion Poisson processes solutions of stochastic differential equations and others The papers treat theoretical aspects of statistics of stochastic processes as well as specific models of stochastic processes from the standpoint of their statistics and control The collection is intended for undergraduate and graduate students and researchers in probability theory and mathematical statistics **Probability Theory and Mathematical Statistics. Small noise is a good noise In this work we are interested in the problems of estimation theory concerned with observations of the diffusion type process $X_0, X_t, 0 \leq t \leq T$ where W is a standard Wiener process and S_t is some nonanticipative smooth t function By the observations $X_0, X_t, 0 \leq t \leq T$ of this process we will solve some of the problems of identification both parametric and nonparametric If the trend S is known up to the value of some finite dimensional parameter $S_t = X_t$ where $E \in \mathbb{R}^d$ then we have a parametric case The nonparametric problems arise if we know only the degree of smoothness of the function $S_t, 0 \leq t \leq T$ with respect to time t It is supposed that the diffusion coefficient c is always known In the parametric case we describe the asymptotical properties of maximum likelihood MLE Bayes BE and minimum distance MDE estimators as $c \rightarrow 0$ and in the nonparametric situation we investigate some kernel type estimators of unknown functions say $S(t), 0 \leq t \leq T$ The asymptotic in such problems of estimation for this scheme of observations was usually considered as $T \rightarrow \infty$ because this limit is a direct analog to the traditional limit $n \rightarrow \infty$ in the classical mathematical statistics of i.i.d observations The limit $c \rightarrow 0$ in $0 \leq t \leq 1$ is interesting for the following reasons **Stochastic Evolution Systems** B.L. Rozovskii, 2012-12-06

Covering the general theory of linear stochastic evolution systems with unbounded drift and diffusion operators this book surveys Ito's second order parabolic equations and explores filtering problems for processes whose trajectories can be described by them

Constrained Markov Decision Processes Eitan Altman, 2021-12-24 This book provides a unified approach for the study of constrained Markov decision processes with a finite state space and unbounded costs Unlike the single controller case considered in many other books the author considers a single controller with several objectives such as minimizing delays and loss probabilities and maximization of throughputs It is desirable to design a controller that minimizes one cost objective subject to inequality constraints on other cost objectives This framework describes dynamic decision problems arising frequently in many engineering fields A thorough overview of these applications is presented in the introduction The book is then divided into three sections that build upon each other

Stochastic Differential Games. Theory and Applications Kandethody M. Ramachandran, Chris P. Tsokos, 2012-01-05 The subject theory is important in finance economics investment strategies health sciences environment industrial engineering etc

Stochastic Systems in Merging Phase Space Vladimir Semenovich Koroliuk, Nikolaos Limnios, 2005 This book provides recent results on the stochastic approximation of systems by weak convergence techniques General and particular schemes of proofs for average diffusion and Poisson approximations of stochastic systems are presented allowing one to simplify complex systems and obtain numerically tractable models The systems discussed in the book include stochastic additive functionals dynamical systems stochastic integral functionals increment processes and impulsive processes All these systems are switched by Markov and semi Markov processes whose phase space is considered in asymptotic split and merging schemes Most of the results from semi Markov processes are new and presented for the first time in this book

Statistics of Random Processes Robert Liptser, Al'bert Nikolaevich Shiryaev, Albert N. Shiryaev, 2001 These volumes cover non linear filtering prediction and smoothing theory and its applications to the problem of optimal estimation control with incomplete data information theory and sequential testing of hypothesis Also presented is the theory of martingales of interest to those who deal with problems in financial mathematics These editions include new material expanded chapters and comments on recent progress in the field

Handbook of Markov Decision Processes Eugene A. Feinberg, Adam Shwartz, 2012-12-06 Eugene A Feinberg Adam Shwartz This volume deals with the theory of Markov Decision Processes MDPs and their applications Each chapter was written by a leading expert in the respective area The papers cover major research areas and methodologies and discuss open questions and future research directions The papers can be read independently with the basic notation and concepts of Section 1.2 Most chapters should be accessible by graduate or advanced undergraduate students in fields of operations research electrical engineering and computer science

1.1 AN OVERVIEW OF MARKOV DECISION PROCESSES The theory of Markov Decision Processes also known under several other names including sequential stochastic optimization discrete time stochastic control and stochastic dynamic programming studies sequential optimization of discrete time stochastic systems The basic object is a discrete time stochastic system whose transition mechanism can be controlled over time Each control policy defines the stochastic process and values of objective functions associated with this process The goal is to select a

good control policy In real life decisions that humans and computers make on all levels usually have two types of impacts i they cost or save time money or other resources or they bring revenues as well as ii they have an impact on the future by influencing the dynamics In many situations decisions with the largest immediate profit may not be good in view of future events MDPs model this paradigm and provide results on the structure and existence of good policies and on methods for their calculation *Statistics and Control of Stochastic Processes* N.V.
