

5.3.3 Stereo-regular Polymers

In stereo-regular polymers, each monomer segment is in a regular configuration, giving a definite structural regularity to the polymer molecule as a whole. This structural regularity, in a polymer may arise due to what are termed as "optical" and "geometric" isomerisms of the main chain atoms or substituents in the polymer molecule. The meaning of these two isomerisms is now explained.

Optical Isomerism

Optical isomerism has its origin in the way different substituents sit on an asymmetric carbon atom in a polymer molecule. We will give an example. A polyethylene molecule has fully saturated carbon atoms with the following chemical formula:

We can write this formula in a linear structural way, showing how various atoms are attached (but without bothering about the bond angles and molecular plane) as follows:

Let us now assume that the carbon-carbon bonds are all on the plane of this paper and that the bonds between the carbon atom and its substituent atoms are either below or above the plane of the paper. The structure of polyethylene in a planar zig-zag configuration is then as shown in Fig. 5.6. In doing this, of course, we have not bothered about the free rotation around each carbon-carbon single bond and the various resultant spatial positions of the polymer segment. It is seen from Fig. 5.6 that all carbon atoms are attached to each other through single bonds which are arranged in a zig-zag manner considering their bond angles. All carbon atoms lie in the plane of the paper but hydrogen atoms

Models of Biopolymers
By Ring-Opening Polymerization Stanislaw Penczek, 2018-01-18 There are a number of methods used to synthetically prepare biopolymers their models and bioanalogous polymers This work approaches the syntheses of the three major groups of

biopolymers existing in nature polypeptides polysaccharides and nucleic and teichoic acids by ring opening polymerization Until now this method has never been reviewed uniformly for these three groups The majority of models prepared by ring opening polymerization can not reach the complexity of the actual biological molecules However a better understanding of these biopolymers will aid in the use of such molecules in several fields of application in research and other high technologies where they mimic functions of related biopolymers in living organisms Polymer Crystallization Jyotishkumar

Treatise on Solid State Chemistry N. Hannay, 2012-12-06 The last quarter century has been marked by the extremely rapid growth of the solid state sciences They include what is now the largest subfield of physics and the materials engineering sciences have likewise flourished And playing an active role throughout this vast area of science and engineering have been very large numbers of chemists Yet even though the role of chemistry in the solid state sciences has been a vital one and the solid state sciences have in turn made enormous contributions to chemical thought solid state chemistry has not been recognized by the general body of chemists as a major subfield of chemistry Solid state chemistry is not even well defined as to content Some for example would have it include only the quantum chemistry of solids and would reject thermodynamics and phase equilibria this is nonsense Solid state chemistry has many facets and one of the purposes of this Treatise is to help define the field Perhaps the most general characteristic of solid state chemistry and one which helps differentiate it from solid state physics is its focus on the chemical composition and atomic configuration of real solids and on the relationship of composition and structure to the chemical and physical properties of the solid Real solids are usually extremely complex and exhibit almost infinite variety in their compositional and structural features

Macromolecules • 1 H.G. Elias, 2012-12-06 The second edition of this textbook is identical with its fourth German edition and it thus has the same goals precise definition of basic phenomena a broad survey of the whole field integrated representation of chemistry physics and technology and a balanced treatment of facts and comprehension The book thus intends to bridge the gap between the often oversimplified introductory textbooks and the highly specialized texts and monographs that cover only parts of macromolecular science The text intends to survey the whole field of macromolecular science Its organization results from the following considerations The chemical structure of macromolecular compounds should be independent of the method of synthesis at least in the ideal case Part I is thus concerned with the chemical and physical structure of polymers Properties depend on structure Solution properties are thus discussed in Part II solid state properties in Part III There are other

reasons for discussing properties before synthesis For example it is difficult to understand equilibrium polymerization without knowledge of solution thermodynamics the gel effect without knowledge of the glass transition temperature etc Part IV treats the principles of macromolecular syntheses and reactions *Macromolecules* Hans-Georg Elias,2013-06-29 Like so many of its kind this textbook originated from the requirements of teaching While lecturing on macromolecular science as a required subject for chemists and materials scientists on the undergraduate graduate and postgraduate levels at Swiss Federal Institute of Technology at Zurich 1960 1971 I needed a one volume textbook which treated the whole field of macromolecular science from its chemistry and physics to its applications in a not too elementary manner This textbook thus intends to bridge the gap between the often oversimplified introductory books and the highly specialized texts and monographs that cover only parts of macromolecular science This first English edition is based on the third German edition 1975 which is about 40% different from the first German edition 1971 a result of rapid progress in macromolecular science and the less rapid education of the writer This text intends to survey the whole field of macromolecular science Its organization results from the following considerations The chemical structure of macromolecular compounds should be independent of the method of synthesis at least in the ideal case Part I is thus concerned with the chemical and physical structure of macro molecules Properties depend on structure Solution properties are thus discussed in Part II solid state properties in Part III There are other reasons for discussing properties before syntheses For example it is difficult to understand equilibrium polymerization without knowledge of solution thermody of the glass temperature etc *Structural Order in Polymers* Francesco Ciardelli,Paolo Giusti,2013-10-22 Structural Order in Polymers presents the increasing importance of the relationships between order in the chemical constitution and in the steric structure of the macromolecules and physical and chemical properties of the polymers This book discusses the simple types of steric order found in biopolymers Organized into three parts encompassing 16 chapters this book begins with an overview of the structural regularity as a primary requisite for the crystallization of a polymer This text then examines the structure of cellulose which is the most significant structural stereoregular polymer Other chapters consider the major concepts of the stereoregulation of propylene catalytic polymerization This book discusses as well the factors that determine microstructure and stereospecificity in polymerization The final chapter deals with the significant role that membranes and membrane related processes play in solving many ecological problems This book is a valuable resource for chemical engineers chemists physicists scientists and research workers *Polypropylene Structure, blends and Composites* J. Karger-Kocsis,2012-12-06 Although polypropylene has been marketed since the 1950s research and development in this area is still vigorous The consumption of polypropylene over the years has been relatively high mainly due to the steady improvement of its property profile Polypropylene Structures Blends and Composites in three separate volumes reflects on the key factors which have contributed to the success of polypropylene dealing with all aspects of structure performance relationships relevant to thermoplastic polymers and related composites

Volume 1 Structure and Morphology deals with polymorphism in polypropylene homo and copolymers where molecular and supermolecular structures are covered and the processing induced structure development of polypropylene showing the interrelation between the processing induced morphology and mechanical performance Volume 2 Copolymers and Blends contains comprehensive surveys of the nucleation and crystallisation behaviour of the related systems It includes the development of morphology and its effects on rheological and mechanical properties of polypropylene based alloys and blends and a review of polypropylene based thermoplastic elastomers Volume 3 Composites gives a comprehensive overview of filled and reinforced systems with polypropylene as a matrix material with the main emphasis on processing structure property interrelationships Chapters cover all aspects of particulate filled chopped fibre fibre mat and continuous fibre reinforced composites Interfacial phenomena such as adhesion wetting and interfacial crystallisation are also included as important aspects of this subject
