Steroid Receptors And The Management Of Cancer Volume I:

Steroid Receptors and the Management of Cancer Edward Brad Thompson, Marc E. Lippman, 1979 Principles and Methods in Receptor Binding F. Cattabeni, 2013-11-11 One of the major advances in the understanding of the mechanism of action of hormones neurotransmitters and drugs had arisen from the hypothesis that the physiological or pharmacological responses are triggered by their interaction with specific cell components termed receptors. However, the presence of receptors has been inferred from indirect data and only recently has it been possible to study the kinetics of the interaction between drug and receptors directly through the so-called binding technique. This NATO ASI on Principles and Methods in Receptor Binding was devoted mainly to the following aspects of the study of receptors: the principles underlying the use of the binding technique; the mathematical models necessary to interpret binding data; the application of binding methods to specific receptors; and finally a few selected examples of coupling between receptors and physiological responses. In the chapters of this book, special interest is devoted to the analysis of the simplest models for the interaction of receptors with their ligands, either hormones or neurotransmitters or drugs. The graphical techniques used to analyze the data from binding experiments are extensively discussed together with the statistics that have to be used in binding analysis. Moreover, the basic concepts to analyze binding data using a personal computer are presented.

PREFACE The factors which should be considered when setting up a binding assay, such as choice of ligand and incubation conditions, preparation of tissue, termination of incubation, are discussed.

Biochemical and Biological Markers of Neoplastic Transformation Prakash Chandra, 2013-11-11 This volume is a record of the proceedings of a NATO Advanced Study Institute on Biochemical and Biological Markers of Neoplastic Transformation held September 28–October 8, 1981, at Corfu, Greece. As early as 1860, Rudolf Virchow provided the first genetic concept of cancer by postulating *Omnia cellulae e cellula ejusdem generis*, a modification of the then existing cell theory *Omnis cellula e cellula*. Thus, the idea that all cells originate from the parent cell was extended to the idea that all cancer cells come from the parent cancer cell. But how the first cancer cell arose or, in other words, how a normal cell changed to a cancer cell, is even after 120 years a mystery. Experimental studies of the past have convinced us that a number of factors contribute to the neoplastic transformation of a normal cell, but our knowledge on the mechanisms involved in this process is still in an embryonic state. In the last few years, however, this field has witnessed a most remarkable advancement catalyzed by the development of modern technology in the allied fields of immunology, the production of monoclonal antibodies, molecular biology, and sequencing.

PREFACE and cloning of oncogenes. Presently, it is becoming more and more evident to the wishful mind of those engaged in this research that we are approaching a turning point. Thus, an assessment of the present situation will be most desirable at this time.

Griffiths, Arlan F. Fuller, 2012-12-06 At the turn of the century gynecology had achieved independence from surgery in most medical schools although gynecologists were surgeons their interests were turning toward nonsurgical aspects of their specialty In 1900 merely two years after the Curies discovery radium was first used as a treatment for carcinoma of the cervix In that day cervical cancer claimed more women's lives than any other malignancy and was described by William P Graves the second professor of gynecology at Harvard as follows Cancer of the cervix may rightly be termed of all tumors one of the most deadly and most ghastly It kills by slow torture causing in later stages months of agonizing pain and producing a discharge of such a foul and nauseating character as to repel proper medical assistance Nurses declined to care for these cases while many public hospitals closed their wards to them as patients In late twentieth century parlance the dramatic results of radium therapy would indeed have been called a breakthrough and radium techniques later combined with external irradiation were developed by gynecologists no longer just surgeons Pathology was the basic science of gynecology and gynecologists with a special interest in pathology served as pathologist to the departments of gynecology As late as 1970 six months of the three year residency program in obstetrics

Bowen,2012-12-06 It is clear that lysosomal enzymes often play a role in the destruction of the cytoplasm but very few authorities feel that they initiate the process Chapters 1 2 3 5 8 12 13 The cells show many forms of damage and sometimes even complete destruction before lysosomes become a dominant part of the environment What initiates the process is still unclear although in several instances it appears that the death of a cell may arise from any one of several pathways Chapters 10 11 It is rather interesting that evolution has chosen to achieve the same goal by different means Apparently no one point is exceptionally or preferentially vulnerable though a common pathway such as permeability of the plasma membrane to calcium Chapter 7 might currently be too subtle for routine identification Factors which affect membrane stability and which induce membrane bending can lead to blebbing cell fragmentation and death Thus more work on the changing chemistry of the plasma membrane in relation to environmental fluctuations would be welcomed Space requirements and the major orientation of the book forced the exclusion of several very interesting topics an evolutionary treatment of the advantages of cell death as a means of eliminating vestigial organs or embryonic scaffolding or consideration of the merits of body sculpting by cell death rather than cell growth **Lactation** Margaret Neville,2013-11-11 This book had its genesis in the frustrations of the editors in locating authoritative up to date material for an interdisciplinary graduate course in mammary gland biology lactation and breast feeding As we turned to the original literature several reasons for the dearth of usable material became clear 1 In the areas of mammary gland biology and physiology particularly as they relate to the human reviews simply have not kept up with current research which has in the last two decades provided tremendous insight into the mechanisms of milk secretion and its control 2 The lack of interest in human milk as infant food inhibited researchers until very recently from investigating human lactation 3 Much of the relevant clinical information remains anecdotal with little scientific basis In this book we have tried to present the fundamentals of mammary gland physiology at the organismic and cellular levels in a form readily understood by physicians scientists and other professionals This basic information is accompanied by authoritative reviews of the nutritional and immunological properties of human milk and by clinically relevant chapters designed to help health care professionals deal with the medical problems of the breast feeding mother and

her infant We have strived in these chapters for up to date authoritative but readable accounts In so far as possible we have avoided areas where much of our understanding rests on speculation In the clinical domain this was not always possible because of a lack of solid scientific information about breast feeding
