Techniques In Cell Cycle Analysis:

Techniques in Cell Cycle Analysis Joe W. Gray, Zbigniew Darzynkiewicz, 2008-02-24 Quantification of the proliferative characteristics of normal and malignant cells has been of interest to oncologists and cancer biologists for almost three decades. This interest stems from a the fact that cancer is a disease of uncontrolled proliferation b the finding that many of the commonly used anticancer agents are preferentially toxic to cells that are actively proliferating and c the observation that significant differences in proliferation characteristics exist between normal and malignant cells. Initially cell cycle analysis was pursued enthusiastically in the hope of generating information useful for the development of rational cancer therapy strategies for example by allowing identification of rapidly proliferating tumors against which cell cycle specific agents could be used with maximum effectiveness and by allowing rational scheduling of cell cycle specific therapeutic agents to maximize the therapeutic ratio. Unfortunately several difficulties have prevented realization of the early promise of cell cycle analysis. Proliferative patterns of the normal and malignant tissues have been found to be substantially more complex than originally anticipated and synchronization of human tumors has proved remarkably difficult. Human tumors of the same type have proved highly variable and the cytokinetic tools available for cell cycle analysis have been labor intensive as well as somewhat subjective and in many cases inapplicable to humans. However the potential for substantially improved cancer therapy remains if more accurate cytokinetic information about human malignancies and normal tissues can be obtained in a timely fashion.

Handbook of Plant Ecophysiology Techniques M. J. Reigosa Roger, 2007-05-08 The Handbook of Plant Ecophysiology Techniques you have now in your hands is the result of several combined events and efforts. The birth of this handbook can be traced as far as 1997 when our Plant Ecophysiology lab at the University of Vigo hosted a practical course on Plant Ecophysiology Techniques. That course showed us how much useful a handbook presenting a bunch of techniques would be for the scientists beginning to work on Plant Ecophysiology. In fact we wrote a short handbook explaining the basics of the techniques taught in that 1997 course: Flow cytometry to measure ploidy levels, Use of a Steady State porometer to measure transpiration, In vivo measure of fluorescence, HPLC analysis of low molecular weight phenolics, Spectrophotometric determinations of free proline and soluble proteins, TLC polyamines contents measures, Isoenzymatic electrophoresis, Use of IRGA and oxygen electrode. That modest handbook written in Spanish was very helpful both for the people who attended the course and for other who have used it for beginning to work in Plant Ecophysiology. The present Handbook is much more ambitious and it includes more techniques. But we have also had in mind the young scientists beginning to work on Plant Ecophysiology. In 1999 Fran ois Pellissier led a proposal presented to the European Commission in the Fifth Framework Program in the High Level Scientific Conferences including three EuroLab Courses about lab and field techniques useful to improve allelopathic research.
