Javois, 2008-02-02 The principle that antibodies can be used as cytochemical agents provided they are tagged with suitable

markers has been evident for over 50 years. During this time the use of immunocytochemical methods has spread to a wide array of biological disciplines. Early applications focused on the detection of microbial antigens in tissues while more recent applications have used monoclonal antibodies to study cell differentiation during embryonic development. For a select few disciplines volumes have been published focusing on the specific application of immunocytochemical techniques to that discipline. What distinguishes the present book *Immunocytochemical Methods and Protocols* from earlier books is its broad appeal to researchers in all disciplines including those in both research and clinical settings. The methods and protocols presented here are designed to be general in their application and the accompanying Notes provide invaluable assistance in adapting or troubleshooting the protocols. Interspersed throughout the book are chapters providing overviews of select topics related to immunocytochemistry.
