Perspectives **Tissue Engineering II** Kyongbum Lee, David L. Kaplan, 2006-10-19 It is our pleasure to present this special volume on tissue engineering in the series *Advances in Biochemical Engineering and Biotechnology*. This volume reflects the emergence of tissue engineering as a core discipline of modern biomedical engineering and recognizes the growing synergies between the technological developments in biotechnology and biomedicine. Along this vein, the focus of this volume is to provide a biotechnology-driven perspective on cell engineering fundamentals while highlighting their significance in producing functional tissues. Our aim is to present an overview of the state of the art of a selection of these technologies punctuated with current applications in the research and development of cell-based therapies for human disease. To prepare this volume, we have solicited contributions from leaders and experts in their respective fields ranging from biomaterials and bioreactors to gene delivery and metabolic engineering. Particular emphasis was placed on including reviews that discuss various aspects of the biochemical processes underlying cell function such as signaling, growth, differentiation, and communication. The reviews of research topics cover two main areas: cellular and non-cellular components and assembly, evaluation, and optimization of tissue function and integrated reactor or implant system development for research and clinical applications. Many of the reviews illustrate how biochemical engineering methods are used to produce and characterize novel materials, e.g., genetically engineered natural polymers, synthetic scaffolds with cell-type specific attachment sites or inductive factors whose unique properties enable increased levels of control over tissue development and architecture.
