Technologies of Power Michael Thad Allen, Gabrielle Hecht, 2001-05-25 This collection explores how technologies become forms of power how people embed their authority in technological systems and how the machines and the knowledge that make up technical systems strengthen or reshape social political and cultural power The authors suggest

ways in which a more nuanced investigation of technology's complex history can enrich our understanding of the changing meanings of modernity. They consider the relationship among the state, expertise and authority, the construction of national identity, changes in the structure and distribution of labor, political ideology and industrial development and political practices during the Cold War. The essays show how insight into the technological aspects of such broad processes can help synthesize material and cultural methods of inquiry and how reframing technology's past in broader historical terms can suggest new directions for science and technology studies. The essays were written in honor of Thomas Parke Hughes and Agatha Chipley Hughes, whose spirit of inquiry they seek to continue. Contributors: Janet Abbate, Michael Thad Allen, W. Bernard Carlson, Gabrielle Hecht, Erik P. Rau, Eric Schatzberg, Amy Slaton, John Staudenmaier, Edmund N. Todd, Hans Weinberger.

Carbon Capture Technologies for Gas-Turbine-Based Power Plants Hamidreza Gohari Darabkhani, Hirbod Varasteh, Bahamin Bazooyar, 2022-09-24. Carbon Capture Technologies for Gas Turbine Based Power Plants explores current progress in one of the most capable technologies for carbon capture in gas turbine based power plants. It identifies the primary benefits and shortcomings of oxy-fuel combustion CO₂ capture technology compared to other capture technologies such as pre-combustion and post-combustion capture. This book examines over 20 different oxy-fuel combustion turbine power cycles by providing their main operational parameters, thermodynamics, and process modelling, energy and exergy analysis, and performance evaluation. The conventional natural gas combined cycle (NGCC) power plant with post-combustion capture is used as the base case scenario. The design procedure and operational characteristics of a radial NO_x less oxy-fuel gas turbine combustor are presented with CFD simulation and performance analysis of the heat exchanger network and turbomachinery. Overview of oxygen production and air separation units (ASU) and CO₂ compression and purification units (CPU) are also presented and discussed. The most advanced stages of development for the leading oxy-fuel power cycles are assessed using techno-economic analysis, sensitivity risk assessments, and levelized cost of energy (LCOE) and analysing technology readiness level (TRL) and development stages. The book concludes with a road map for the development of future gas turbine based power plants with full carbon capture capabilities using the experiences of the

recently demonstrated cycles Analyzes more than 20 models of oxyturbine power cycles identifying the main parameters regarding their operation process and performance simulations and energy and exergy analysis Provides techno economic analysis TRL sensitivity and risk analysis LCOE and stages of development for oxy combustion turbine power plants Presents the design procedure and CFD simulation of a radial NOx less oxy fuel gas turbine combustor exploring its influence on heat exchanger network and turbomachinery Supports practitioners policymakers and energy industry managers seeking pathways to convert coal fired power plants to gas fired plants with zero CO2 emission **Power Generation**
