Stress Analysis of Fiber-reinforced Composite Materials M. W. Hyer, Scott R. White, 2009 Updated and improved Stress Analysis of Fiber Reinforced Composite Materials Hyer's work remains the definitive introduction to the use of mechanics to understand stresses in composites caused by deformations loading and temperature changes In contrast to a materials science approach Hyer emphasizes the micromechanics of stress and deformation for composite material analysis The book provides invaluable analytic tools for students and engineers seeking to understand composite properties and failure limits A key feature is a series of analytic problems continuing throughout the text starting from relatively simple problems which are built up step by step with accompanying calculations The problem series uses the same material properties so the impact of the elastic and thermal expansion properties for a single layer of FR material on the stress strains elastic properties thermal expansion and failure stress of cross ply and angle ply symmetric and unsymmetric laminates can be evaluated The book shows how thermally induced stresses and strains due to curing add to or subtract from those due to applied loads Another important element and one unique to this book is an emphasis on the difference between specifying the applied loads i e force and moment results often the case in practice versus specifying strains and curvatures and determining the subsequent stresses and force and moment results This represents a fundamental distinction in solid mechanics *Handbook of Fiber Chemistry, Second Edition, Revised and Expanded* Menachem Lewin, Eli M. Pearce, 1998-02-26 Offers comprehensive coverage of the most important natural and synthetic fibers used in consumer goods agriculture industry medicine and engineering Second Edition provides entirely new coverage of topics such as vinyl fibers mammalian fibers related to wool cotton jute silk and kenaf fibers and acrylic fibers **Engineered Interfaces in Fiber Reinforced Composites** Jang-Kyo Kim, Yiu-Wing Mai, 1998-10-21 The study and application of composite materials are a truly interdisciplinary endeavour that has been enriched by contributions from chemistry physics materials science mechanics and manufacturing engineering The understanding of the interface or interphase in composites is the central point of this interdisciplinary effort From the early development of composite materials of various nature the optimization of the interface has been of major importance While there are many reference books available on composite materials few of them deal specifically with the science and mechanics of the interface of fiber reinforced composites Further many recent advances devoted solely to research in composite interfaces have been scattered in a variety of published literature and have yet to be assembled in a readily accessible form To this end this book is an attempt to bring together recent developments in the field both from the materials science and mechanics perspective in a single convenient volume The central theme of the book is tailoring the interface properties to optimise the mechanical performance and structural integrity of composites with enhanced strength stiffness

and fracture toughness or specific fracture resistance It deals mainly with interfaces in advanced composites made from high performance fibers such as glass carbon aramid ultra high modulus polyethylene and some inorganic e g B W Al₂O₃ SiC fibers and matrix materials encompassing polymers metals alloys and ceramics The book is intended to provide a comprehensive treatment of composite interfaces in such a way that it should be of interest to materials scientists technologists and practising engineers as well as graduate students and their supervisors in advanced composites We hope that this book will also serve as a valuable source of reference to all those involved in the design and research of composite interfaces The book contains eight chapters of discussions on microstructure property relationships with underlying fundamental mechanics principles In Chapter 1 an introduction is given to the nature and definition of interfaces in fiber reinforced composites Chapter 2 is devoted to the mechanisms of adhesion which are specific to each fiber matrix system and the physio chemical characterization of the interface with regard to the origin of adhesion The experimental techniques that have been developed to assess the fiber matrix interface bond quality on a microscopic scale are presented in Chapter 3 along with the techniques of measuring interlaminar intralaminar strengths and fracture toughness using bulk composite laminates The applicability and limitations associated with loading geometry and interpretation of test data are compared Chapter 4 presents comprehensive theoretical analyses based on shear lag models of the single fiber composite tests with particular interest being placed on the interface debond process and the nature of the fiber matrix interfacial bonding Chapter 5 is devoted to reviewing current techniques of fiber surface treatments which have been devised to improve the bond strength and the fiber matrix compatibility stability during the manufacturing processes of composites The micro failure mechanisms and their associated theories of fracture toughness of composites are discussed in Chapter 6 The roles of the interface and its effects on the mechanical performance of fiber composites are addressed from several viewpoints Recent research efforts to augment the transverse and interlaminar fracture toughness by means of controlled interfaces are presented in Chapters 7 and 8
