Paulo Henrique Rosado-de-Castro, Andrew N. Clarkson, Johannes Boltze, Koji Abe, Mirosław Janowski, Pedro M. Pimentel-Coelho, Olivier Detante, 2020-05-22 **Stroke Rehabilitation** Leeanne M. Carey, 2012-06-28 Stroke Rehabilitation Insights from Neuroscience and Imaging informs and challenges neurologists rehabilitation therapists imagers and stroke specialists to adopt more restorative and scientific approaches to stroke rehabilitation based on new evidence from neuroscience and neuroimaging literatures The fields of cognitive neuroscience and neuroimaging are advancing rapidly and providing new insights into human behavior and learning Similarly improved knowledge of how the brain processes information after injury and recovers over time is providing new perspectives on what can be achieved through rehabilitation Stroke Rehabilitation explores the potential to shape and maximize neural plastic changes in the brain after stroke from a multimodal perspective Active skill based

learning is identified as a central element of a restorative approach to rehabilitation. The evidence behind core learning principles as well as specific learning strategies that have been applied to retrain lost functions of movement, sensation, cognition and language are also discussed. Current interventions are evaluated relative to this knowledge base and examples are given of how active learning principles have been successfully applied in specific interventions. The benefits and evidence behind enriched environments is reviewed with examples of potential application in stroke rehabilitation. The capacity of adjunctive therapies such as transcranial magnetic stimulation to modulate receptivity of the damaged brain to benefit from behavioral interventions is also discussed in the context of this multimodal approach. Focusing on new insights from neuroscience and imaging, the book explores the potential to tailor interventions to the individual based on viable brain networks.

Clinical Pathways in Stroke Rehabilitation Thomas Platz, 2021-01-14. This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation. Consequences of diseases e.g. impairments and activity limitations are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation, bridging the gap between clinical evidence and clinical decision making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic but concise review of the evidence, RCTs, systematic reviews and meta-analyses that is relevant for clinical decision making and comments on assessment, therapy, training, technology, medication and the use of technical aids as appropriate. Based on these summaries, clinical algorithms, pathways are provided and the main clinical decision situations are portrayed. The book is invaluable for all

The Ischemic Penumbra: Still the Target for Stroke Therapies? Argye E. Hillis, Jean-Claude Baron, 2015-07-23

The ischemic penumbra was initially defined by Symon Lassen and colleagues in the 1970s as an area of brain tissue with inadequate blood flow to maintain electric activity of neurons but adequate blood flow to preserve the function of the ion channels. This area of tissue receiving enough blood to survive but not enough to function often surrounds or abuts the irreversibly damaged core in ischemic stroke. It was shown that if blood flow could be restored to this area of marginal perfusion the tissue could survive and function again and growth of the core could be prevented. Based on seminal PET studies, penumbra or penumbral tissue eventually took on a subtly different meaning: the area of brain that is destined to progress to infarct unless blood flow is restored within a particular time window. The penumbra thus became the target for all acute stroke interventions to preserve viability of the tissue and restore function. New imaging techniques including diffusion and perfusion MRI and CT perfusion were developed to rapidly identify individuals with penumbra who were thought to be the best candidates for aggressive interventions to restore blood flow, particularly beyond the licensed time window for IV thrombolysis. However, most clinical trials have failed to establish the usefulness of identifying candidates for treatment in this way using pre-specified protocols and primary endpoints. These trials have used different and sometimes unvalidated thresholds of hypoperfusion as well as irreversible infarct and various definitions of significant penumbra or mismatch between irreversible infarct and hypoperfused but salvageable tissue. Reanalysis of their data using more refined image processing showed post hoc positivity. They have also evaluated outcome in a variety of ways with few studies measuring the direct effect of restoring blood flow on the function of the penumbral tissue. Therefore, important remaining questions include how to define, characterize, and image the penumbra in acute stroke to achieve the greatest reliability and validity for what we want to measure and whether this concept so defined provides an optimal target for stroke therapy using state-of-the-art trial design.
