This review covers the heterometallic complexes of lead, and is the first of three reviews. The other two are surveys of about two hundred oxo-acids and halides and nearly four hundred coordination complexes of lead. There are over sixty of heterometallic derivatives in which the heterometal atoms include both transition and non-transition metals, both hard (class A) and soft (class B). The bi-, tri- and pentanuclear derivatives exhibit the most examples, with tetra-, deca- and polynuclear examples also occurring. Both Pb(II) and Pb(IV) oxidation states are represented, and one decanuclear example with lead in an anionic cluster. The compounds include both organometallic and coordination complexation around the lead and heterometal atoms.
