Chemistry Methodology in Materials Science presents informative new research on computational chemistry as applied to materials science. The wide range of topics regarding the application of theoretical and experimental chemistry and materials science and biological domain will be valuable in the context of addressing contemporary research problems. Advances in Protein Chemistry and Structural Biology Alexander McPherson, 2010-09-09. Structural genomics is the systematic determination of 3D structures of proteins representative of the range of protein structure and function found in nature. The goal is to build a body of structural information that will predict the structure and potential function for almost any protein from knowledge of its coding sequence. This is essential information for understanding the functioning of the human proteome, the ensemble of tens of thousands of proteins specified by the human genome. While most structural biologists pursue structures of individual proteins or protein groups, specialists in structural genomics pursue structures of proteins on a genome-wide scale. This implies large-scale cloning, expression, and purification. One main advantage of this approach is economy of scale. Examines the three-dimensional structure of all proteins of a given organism by experimental methods such as X-ray crystallography and NMR spectroscopy. Looks at structural genomics as a foundation of drug discovery, as discovering new medicines is becoming more challenging and the pharmaceutical industry is looking to new technologies to help in this mission.
