Structures Technology for Large Radio and Radar Telescope Systems James W. Mar, Harold Liebowitz, 2003-02-01

The national interest in large radio and radar telescope systems spans the entire engineering and scientific community and there is every indication that the country will embark upon the construction of still more of these systems in the near future. Radio and radar astronomers now require very large mechanical devices. The system specifications lead to structural criteria which are unique and outside the immediate interest and/or capability of most of the structures community. Radio and radar telescopes and the radomes that may protect them are often enormous structures. Their design presents extremely complicated technological problems. These instruments must operate with precision in varied environments and environmental conditions. Radomes must protect radio and radar antennas without seriously interfering with the incoming information. The Office of Naval Research and MIT cosponsored an international conference in 1967 on the structural problems associated with large radio and radar telescope systems the proceedings of which are collected here. The papers in this book deal with the problems outlined above from several points of view. The contents of the papers can be grouped roughly as follows: 1. Requirements and standards for supporting structures tracking equipment antennas and radomes. 2. Design and performance of existing systems. 3. Theoretical analysis of the structures of supporting structures antennas and radomes. In some cases the analysis is made for a structure under stress. Computer techniques are described for several problems. 4. Methods for evaluating actual or predicted performance of various structures. Here again computer techniques are employed.

Reflector antennas are widely used in the microwave and millimeter wavelength domain Radio astronomers have developed techniques of calibration of large antennas with radio astronomical methods These have not been comprehensively described This text aims to fill this gap It takes a practical approach to the characterisation of antennas All calculations and results in the form of tables and figures have been made with Mathematica by Wolfram Research The reader can use the procedures for the implementation of his own input data The book should be of use to all who are involved in the design and calibration of large antennas like ground station managers and engineers practicing radio astronomers and graduate students in radio astronomy and communication technology STRUCTURES TECHNOLOGY FOR LARGE RADIO AND RADAR TELESCOPE SYSTEMS- PAPERS PRESENTED AT THE INTERNATIONAL SYMPOSIUM- OFFICE OF NAVAL RESEARCH- MASSACHUSETTS INSTITUTE OF TECHNOLOGY. , Structures Technology for Large Radio and Radar Telescope Systems: Proceedings of an International Symposium...
