The Management Science System:

Some Developments in Management Science and Information Systems with Respect to Measurement in Accounting Carnegie Institute of Technology. School of Industrial Administration, Neil Churchill, Andrew Stedry, 1965
Developing techniques in management science behavioral science and information systems are discussed in the context of accounting measurement Data requirements for implementation of the new planning and control techniques are considered and compared with data furnished by accounting reports Input data and aggregation in contemporary information systems are compared with recording and classification in conventional accounting systems It is proposed that accounting measurement principles be developed for data in micro units much smaller than the transaction which serve as data inputs in on line real time information systems It is also proposed that accounting measurement principles be extended to include non monetary units and in particular to evaluating the measurement procedures used in determining the macro units much larger than the transaction which serve as inputs for planning and control techniques developed in the management and behavioral sciences Author

This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects, advances in the theories on their interrelations, the enormous computational capacity provided by IT hardware and software, and the critical revisiting of subject-object interaction, not to mention the urgent need to control the efficiency of complex systems where efficiency is

understood to mean the ability to find a solution to many social problems including those posed on a planetary scale The result has been the forging of a new academically consolidated scientific trend going by the name of Systems Theory and Cybernetics with a comprehensive multi disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic This subject entry is subdivided into four sections The first an introduction to systemic theories addresses the historic development of the most commonly used systemic approaches from new concepts such as the so called geometry of thinking or the systemic treatment of non systemic identities to the taxonomic entropic axiological and ethical problems deriving from a general systemic cybernetic conceit Hence the focus in this section is on the historic and philosophical aspects of the subject Moreover it may be asserted today that beyond a shadow of a doubt problems in particular problems deriving from human interaction but in general any problem regardless of its nature must be posed from a systemic perspective for otherwise the obstacles to their solution are insurmountable Reaching such a perspective requires taking at least the following well known steps a statement of the problem from the determinant variables or phenomena b adoption of theoretical models showing the interrelationships among such variables c use of the maximum amount of wherever possible quantitative information available on each d placement of the set of variables in an environment that inevitably pre determines the problem That epistemology would explain the substantial development of the systemic cybernetic approach in recent decades The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems from issues that affect humanity as a whole to minor but specific questions arising in human organizations Certain sub themes are discussed by the various authors always from a didactic vantage including problem discovery and diagnosis and development of the respective critical theory the design of ad hoc strategies and methodologies the implementation of both qualitative soft system methodologies and formal and quantitative such as the General System Problem Solver or the axiological operational perspective approaches cross disciplinary integration and suitable methods for broaching psychological cultural and socio political dynamisms The third section is devoted to cybernetics in the present dual meaning of the term on the one hand control of the effectiveness of communication and actions and on the other the processes of self production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed Known as second order cybernetics this provides an avenue for rethinking the validity of knowledge such as for instance when viewed through what is known as bipolar feedback processes through which interactions create novelty complexity and diversity Finally the fourth section centres around artificial and computational intelligence addressing sub themes such as neural networks the simulated annealing that ranges from statistical thermodynamics to combinatory problem solving such as in the explanation of the role of adaptive systems or when discussing the relationship between biological and computational intelligence

A Systems Perspective on Financial Systems Jeffrey Yi-Lin Forrester, 2014-03-03 This book is devoted to a systems theoretical presentation of the main results of applying the systemic yoyo model and relevant analytical tools to the topics of money and financial institutions. The author presents the main concepts and results of the subject matter in the language of systems science, which has in the past century prompted revolutionary applications of systems research in various subfields of traditional disciplines. This volume applies a brand new logic of reasoning to some of the unsettled problems in the area of money and banking. Due to the particular systemic approach employed, the reader will be able to see how different economic activities are implicitly related to each other and how financial decisions are holistically made in reference to seemingly unrelated events. That is, the learning of this particular subject matter takes place at a different, more elevated level from which, among others, economies are respectively seen as both closed and open systems; their interactions emulate those of rotational pools of fluids. This book can be used as a textbook for researchers and graduate students in economics, finance, systems science, and mathematical systems modeling. It will also be useful as a reference book for applied economists and various policy makers.
