

# A GUIDE TO THE MAILLARD REACTION

The Maillard reaction occurs during cooking, and it is responsible for the non-enzymatic browning of foods when cooked. It actually consists of a number of reactions, and can occur at room temperature, but is optimal between 140-165°C. The Maillard reaction occurs in three stages, detailed here.

1

The carbonyl group on a sugar reacts with a protein or amino acid's amino group, producing an N-substituted glycosylamine.

2

The glycosylamine compound generated in the first step isomerises, by undergoing Amadori rearrangement, to give a ketosamine.

3

The ketosamine can react in a number of ways to produce a range of different products, which themselves can react further.

## Classes of Maillard Reaction Products

The Maillard reaction produces hundreds of products; a small subset of these contribute to flavour and aroma, some groups of which are described below. Melanoidins are also formed; brown, polymeric substances which contribute to the colouration of many cooked foods.

**Maillard Reaction** S. E. Faye, Juliet A. Gerrard, 2002 It is almost 100 years since the Maillard reaction was first described. Despite decades of research since then, the products of the reaction and the mechanistic pathways leading to their formation are only gradually being unravelled. Combining comprehensive information regarding the various methods that can be employed in the analysis of Maillard products with a discussion of the advantages and limitations of those methods, this unique book provides a one-stop text from which methods of analysis may be obtained. It will be useful for both new and experienced researchers who are involved in solving the mysteries and complexities of Maillard chemistry. The Maillard Reaction Reconsidered Jack N. Losso, 2016-04-19 Cooking involves chemical reactions that can make food smell and taste better. However, the same process that is responsible for creating the aroma, flavor, palatability, color, and taste of grilled and seared foods has also been linked to the development of chronic degenerative diseases. The Maillard reaction produces advanced glycation end products. **Foodborne Disease Handbook, Second Edition** Y. H. Hui, 2018-01-18 A study of foodborne disease focusing on seafood and environmental toxins. This second edition discusses fish, shellfish, and freshwater and marine organisms affected by agricultural and food processing products, including raw sewage, industrial effluents, trash, and garbage, pesticide runoff from crop lands, and top soils, and more. **Chronic Complications in Diabetes** Anders A. F. Sima, 2014-04-21 Individual volumes in the series Frontiers in Animal Diabetes Research provide basic researchers as well as clinical investigators with in-depth coverage of basic experimental diabetes research. Each volume will be topic-oriented with timely and liberally referenced reviews. Oxidative Stress and Vascular Disease John F. Keaney Jr., 2012-12-06 One of the major biomedical triumphs of the post World War II era was the definitive demonstration that hypercholesterolemia is a key causative factor in atherosclerosis: that hypercholesterolemia can be effectively treated and that treatment significantly reduces not only coronary disease mortality but also all-cause mortality. Treatment to lower plasma levels of cholesterol, primarily low-density lipoprotein (LDL) cholesterol, is now accepted as best medical practice, and both physicians and patients are being educated to take aggressive measures to lower LDL. We can confidently look forward to important decreases in the toll of coronary artery disease over the coming decades. However, there is still uncertainty as to the exact mechanisms by which elevated plasma cholesterol and LDL levels initiate and favor the progression of lesions. There is general consensus that one of the earliest responses to hypercholesterolemia is the adhesion of monocytes to aortic endothelial cells, followed by their penetration into the subendothelial space where they differentiate into macrophages. These cells, and also medial smooth muscle cells that have migrated into the subendothelial space, then become loaded with multiple large droplets of cholesterol esters, the hallmark of the earliest visible atherosclerotic lesion, the so-called fatty streak. This lesion is the precursor of the more advanced lesions both in animal models and in humans. Thus, the centrality of hypercholesterolemia cannot be overstated. Still

the atherogenic process is complex and evolves over a long period of time

Fraser-Reid, Kuniaki Tatsuta, Joachim Thiem, 2012-12-06 Glycostructures play a highly diverse and crucial role in a myriad of organisms and important systems in biology physiology medicine bioengineering and technology Only in recent years have the tools been developed to partly understand the highly complex functions and the chemistry behind them but many facts still remain undiscovered All roads lead to carbohydrates we cannot do without them K C Nicolaou Presently the field is experiencing a quantum jump Therefore the editors have drawn together in this three volume set plus an accompanying CD ROM the complete and up to date information on glycostructures their chemistry and chemical biology and present them in the form of a comprehensive and strictly systematic survey The texts are furnished by 2 670 figures chemical structures and reaction schemes including more than 12 000 individual chemical reactions and more than 9 000 references
