Structure And Properties Of Ceramics:

Structure and Properties of Ceramics A. Koller, 1994-06-03 Modern ceramic materials differ from the traditional materials which were only based on natural substances. It is now possible to prepare ceramics using a wide range of properties and as an area this field has evolved as a very broad scientific and technical field in its own right. In practice one encounters ceramics in practically all branches of materials science and the characteristics are so wide ranging that the common basis of these substances is not always immediately apparent. All ceramic materials are prepared by ceramic technology and powder substances are used as the initial raw materials. Their physical properties are an expression not only of their composition but primarily of their structure. Thus in order to fully understand the properties of ceramics a knowledge of their structure is essential. This book is intended as a source of such knowledge. All the chapters are written by authors with vast experience in the various fields of ceramics who provide a detailed description of the interrelationships between the structure and behaviour of ceramic materials.

Materials Handbook François Cardarelli, 2013-11-11 Despite the several comprehensive series available in Material Sciences and their related fields it is a hard task to find grouped properties of metals and alloys, ceramics, polymers, minerals, woods and building materials in a single volume source book. Actually the scope of this practical handbook is to provide to scientists, engineers, professors, technicians and students working in numerous scientific and technical fields ranging from nuclear to civil engineering, easy and rapid access to the accurate physico-chemical properties of all classes of materials. Classes used to describe the materials are: i metals and their alloys ii semiconductors iii superconductors iv magnetic materials v miscellaneous electrical materials e g dielectrics thermocouple and industrial electrode materials vi ceramics, refractories and glasses vii polymers and elastomers viii minerals, ores, meteorites and rocks ix timbers and woods and finally x building materials. Particular emphasis is placed on the properties of the most common industrial materials in each class. Physical and chemical properties usually listed for each material are: i mechanical e g density, elastic moduli, Poisson's ratio, yield and tensile strength, hardness, fracture toughness ii thermal e g melting point, thermal conductivity, specific heat capacity, coefficient of linear thermal expansion, spectral emissivities iii electrical e g resistivity, dielectric permittivity, loss tangent, factor iv magnetic e g magnetic permeability, remanence, Hall constant v optical e g refractive indices, reflective index vi electrochemical e g
