Managed Software Evolution Ralf Reussner, Michael Goedicke, Wilhelm Hasselbring, Birgit Vogel-Heuser, Jan Keim, Lukas Martin, 2019-06-26 This open access book presents the outcomes of the Design for Future Managed Software Evolution priority program 1593 which was launched by the German Research Foundation Deutsche Forschungsgemeinschaft DFG to develop new approaches to software engineering with a specific focus on long lived software systems The different lifecycles of software and hardware platforms lead to interoperability problems in such

systems Instead of separating the development adaptation and evolution of software and its platforms as well as aspects like operation monitoring and maintenance they should all be integrated into one overarching process Accordingly the book is split into three major parts the first of which includes an introduction to the nature of software evolution followed by an overview of the specific challenges and a general introduction to the case studies used in the project The second part of the book consists of the main chapters on knowledge carrying software and cover tacit knowledge in software evolution continuous design decision support model based round trip engineering for software product lines performance analysis strategies maintaining security in software evolution learning from evolution for evolution and formal verification of evolutionary changes In turn the last part of the book presents key findings and spin offs The individual chapters there describe various case studies along with their benefits deliverables and the respective lessons learned An overview of future research topics rounds out the coverage The book was mainly written for scientific researchers and advanced professionals with an academic background They will benefit from its comprehensive treatment of various topics related to problems that are now gaining in importance given the higher costs for maintenance and evolution in comparison to the initial development and the fact that today most software is not developed from scratch but as part of a continuum of former and future releases

**Software Blueprints** David S. Robertson,Jaume Agustí,1999 Conceptual models are descriptions of our ideas about a problem used to shape the implementation of a solution to it Everyone who builds complex information systems uses such models be they requirements analysts knowledge modellers or software designers but understanding of the pragmatics of model design tends to be informal and parochial Lightweight uses of logic can add precision without destroying the intuitions we use to interpret our descriptions Computing with logic allows us to make use of this precision in providing automated support tools Modern information scientists need to know what these methods are for and may need to build their own This book gives you a place to begin Where do you start when building models in a precise language like logic One way is by following standard paradigms for design and adapting these to your needs Some of these come from an analysis of existing informal notations Others are from within logic itself We take you through a sample of these from more commonplace styles of formal modelling to non standard methods such as techniques editing and argumentation Each of these provides a window onto broader areas of applied logic and gives you a basis for adapting the method to your own needs
