Nejat Veziroglu, 2013-10-08 Hydrogen Systems Volume I is a collection of papers presented at the International Symposium on Hydrogen Systems held in Beijing China on May 7 11 1985 The symposium provided a forum for reviewing the state of the art in hydrogen systems as an alternative source of energy The discussions are organized around the following themes hydrogen from fossil fuels electrolysis photolytic hydrogen generation thermo and photochemical methods of hydrogen production hydrogen from hydrogen sulfide catalysts bio production of hydrogen novel and hybrid methods of hydrogen production hydrogen storage and handling metal titanium lanthanum and light hydrides and hydrogen utilization Comprised of 53 chapters this volume first deals with central place theory and the dominance of hydrogen as an energy carrier followed by a detailed account of hydrogen production from fossil

fuels such as coal and petroleum coke The reader is systematically introduced to photoelectrocatalytic splitting of water into hydrogen by doping sandwich semiconductor photoelectrodes and visible light induced formation of hydrogen from hydrogen sulfide Subsequent chapters explore the photocatalytic cleavage of water on noble metal photocatalysis with particular reference to hydrogen generation through photoinduced reduction of water and oxygen generation through photoinduced oxidation of water hydrogen production using an immobilized co culture of anaerobic and photosynthetic bacteria and storage and handling of liquid hydrogen in automotive vehicles This monograph will be of interest to scientists engineers environmentalists and energy planners

Electrochemical Energy Storage for Renewable Sources and Grid

Balancing Patrick T. Moseley, Jürgen Garche, 2014-10-27 Electricity from renewable sources of energy is plagued by fluctuations due to variations in wind strength or the intensity of insolation resulting in a lack of stability if the energy supplied from such sources is used in real time An important solution to this problem is to store the energy electrochemically in a secondary battery or in hydrogen and its derivatives and to make use of it in a controlled fashion at some time after it has been initially gathered and stored Electrochemical battery storage systems are the major technologies for decentralized storage systems and hydrogen is the only solution for long term storage systems to provide energy during extended periods of low wind speeds or solar insolation Future electricity grid design has to include storage systems as a major component for grid stability and for security of supply The technology of systems designed to achieve this regulation of the supply of renewable energy and a survey of the markets that they will serve is the subject of this book It includes economic aspects to guide the development of technology in the right direction Provides state of the art information on all of the storage systems together with an assessment of competing technologies Features detailed technical economic and environmental impact information of different storage systems Contains information about the challenges that must be faced for batteries and hydrogen storage to be used in conjunction with a fluctuating renewable energy power supply
