□□□□□□□□,2003 **Dynamic Trip Modelling** Robert G.V. Baker,2006-08-05 The thesis of this book is that there are one set of equations that can define any trip between an origin and destination The idea originally came from work that I did when applying the hydrodynamic analogy to study congested traffic flows in 1981 However I was disappointed to find out that much of the mathematical work had already been done decades earlier When I looked for a new application I realised that shopping centre demand could be like a longitudinal wave governed by centre opening and closing times Further a solution to the differential equation was the gravity model and this suggested that time was somehow part of distance decay This was published in 1985 and represented a different approach to spatial interaction modelling The next step was to translate the abstract theory into something that could be tested empirically To this end I am grateful to my Ph D supervisor Professor Barry Garner who taught me that it is not sufficient just to have a theoretical model This book is an outcome of this on going quest to look at how the evolution of the model performs against real world data This is a far more difficult process than numerical simulations but the results have been more valuable to policy formulation and closer to what I think is spatial science The testing and application of the model required the compilation of shopping centre surveys and an Internet data set
