Requirements Targeting Software and Systems Engineering Manfred Broy, Bernhard Rumpe, 1998-11-04 Software engineering research has different profiles in Europe and North America While in North America there is a lot of know how in the practical technical and organizational aspects of software engineering in Europe the work concentrates more on foundations and formal modeling of software engineering issues Both approaches have their individual strengths and weaknesses Research driven solely by practice in software engineering runs in the danger of developing into a shallow field failing to find a solid scientific basis or to contribute substantially to the progress in software engineering Work concentrating on formal aspects alone is in the danger of becoming too theoretical and isolated from practice so that any transfer into practical application will fail Substantial progress in software engineering can be achieved however by bringing together pragmatic and foundational work in software engineering research This can provide a step towards a common scientific basis for software engineering that allows us to integrate the various research results leading to fruitful synergetic effects It will also help to identify critical research paths and to develop an adequate paradigm for the scientific discipline of software engineering In software and systems engineering it is necessary to distinguish the en

mous difference between the dynamics in development we refer to and the limited scope assumed by many of today's software managers who still use outdated techniques. Many of the unsolved problems associated with the old techniques are symptoms of a lack of formalization and a lack of automation support. It was the goal of this workshop to bring together experts from science and practice in software and systems engineering from North America and Europe.
