comparing different systems and evaluating them in the context of the World Reference Base WRB for Soil Resources The latter was set up to resolve these problems by creating an international umbrella system for soil correlation All soil scientists should then classify soils using the WRB as well as their national systems The book is a definitive and essential reference work for all students studying soils as part of life earth or environmental sciences as well as professional soil scientists Published with International Union of Soil Sciences

Soil Quality for Crop Production and Ecosystem Health E.G. Gregorich, M.R. Carter, 1997-11-10 Soil is a complex body that exists as many types each with diverse properties that may vary widely across time and space as a function of many factors This complexity makes the evaluation of soil quality much more challenging than that of water or air quality Evaluation of soil quality now considers environmental implications as well as economic productivity seeking to be more holistic in its approach Thus soil quality research draws from a wide range of disciplines blending the approaches of biologists physicists chemists ecologists economists and agronomists among others This book presents a broad perspective of soil quality that includes these various perspectives and gives a strong theoretical basis for the assessment of soil quality A short glossary provides definitions for terms used throughout the book
