The global high demands for food, fiber, feed and fuel put a constant strain on the environment which can only be mitigated by soil conservation. This edition incorporates new concepts and provides an up to date review of soil management principles and practices. The authors also added new chapters on cover crops, crop residues, soil water management, nutrient management, perennials in crop rotations and organic amendments. All practices have a clear perspective on addressing soil erosion, physical and chemical problems, carbon dynamics and sequestration as well as non point source pollution. The restorative nature of many practices also consider water conservation as a main pillar of sustaining a healthy soil. This textbook is valuable for students and professionals in soil science, agronomy, agricultural engineering, hydrology and management of natural resources.
