**Observational Constraints on the Influence of Active Galactic Nuclei on the Evolution of Galaxies** Christopher Mark Harrison, 2016-01-20 This prize winning Ph D thesis by Chris Harrison adopts a multi faceted approach to address the lack of decisive observational evidence utilising large observational data sets from several world leading telescopes Developing several novel observational techniques Harrison demonstrated that energetic winds driven by Active Galactic Nuclei AGN are found in a large number of galaxies with properties in agreement with model predictions One of the key unsolved problems in astrophysics is understanding the influence of AGN the sites of growing supermassive black holes on the evolution of galaxies Leading theoretical models predict that AGN drive energetic winds into galaxies regulating the formation of stars However until now we have lacked the decisive observational evidence to confirm or refute these key predictions Careful selection of targets allowed Harrison to reliably place these detailed observations into the context of the overall galaxy population However in disagreement with the model predictions Harrison showed that AGN have little global effect on star formation in galaxies Theoretical models are now left with the challenge of explaining these results
