Robust Control Theory in Hilbert Space Avraham Feintuch,2012-12-06 Motivation The latest texts on linear systems for engineering students have begun incorporating chapters on robust control using the state space approach to HOC control for linear finite dimensional time invariant systems While the pedagogical and computational advantages of this approach are not to be underestimated there are in my opinion some disadvantages Among these disadvantages is the narrow viewpoint that arises from the amputation of the finite dimensional time invariant case from the much more general theory that had been developed using frequency domain methods The frequency domain which occupied center stage for most of the developments of HOC control theory presents a natural context for analysis and controller synthesis for time invariant linear systems whether of finite or infinite dimensions A fundamental role was played in this theory by operator theoretic methods especially the theory of Toeplitz and skew Toeplitz operators The recent lecture notes of Foias Ozbay and Tannenbaum 3 display the power of this theory by constructing robust controllers for the problem of a flexible beam Although controller synthesis depends heavily on the special computational advantages of time invariant systems and the relationship between HOC optimization and classical interpolation methods it turns out that the analysis is possible without the assumption that the systems are time invariant

Geometries of Learning Pavan Turaga, Yunye Gong,P. Thomas Fletcher,Ajay Divakaran,2025-04-25 Deep neural networks have demonstrated great success in many computer vision applications where intelligent recognition and analysis are performed based on high dimensional visual data However in contrast to the rapid development of advanced architectures and training schemes developments have been limited in the theory of analyzing deep neural networks and deep learning training through the lens of geometries The lack of such analysis prevents further understanding and affects the acceptance of deep neural networks for practical applications For example deep neural networks are often challenged by their vulnerability to adversarial attacks their lack of systematic guarantees on effectiveness and stability and their degraded generalization capability outside the distribution of training data
