by R.D. Reed and J.S. Hollister Ralph Daniel Reed, Joseph Steffens Hollister,      **Current Topics in Structural Geology** P.  
L. Hancock, 2013-08-29 Current Topics in Structural Geology is a collection of invited papers on particular topics of interest  
in structural geology from field based problems on the scale of terranes to microstructures in nature and experiment  
Contributors also explore earthquake faulting S C mylonites tectonics and hydrogeology of accretionary prisms deformation  
mechanisms transparent polycrystals shape and lattice preferred orientations and mushroom shaped diapirs This text is  
comprised of 13 chapters the first of which introduces the reader to shallow crustal earthquakes and the structural geology  
of fault zones The first chapter also emphasizes the seismogenic regime strike slip earthquake rupture processes structural  
questions posed by seismology and mesothermal gold quartz lodes hosted in steeply inclined shear zones of mixed brittle  
ductile character Discussion then turns to normal faulting in the upper continental crust along with the application of a  
method based primarily on fault slip data analysis to determine paleostress in terms of orientation and magnitude The  
mechanical behavior and deformation textures of simulated halite shear zones are considered with special regard to the  
internal structures of S C mylonites and their mechanical implications The remaining chapters examine the role of  
decollement zone in the tectonics and hydrogeology of accretionary prisms synkinematic microscopy of transparent  
polycrystals and the origin of metamorphic core complexes and detachment faults formed during Tertiary continental  
extension in the northern Colorado River region This book is intended primarily for students and practitioners of structural

includes petrology geochronology and regional aspects of individual plutons as well as evolution of the Peninsular Ranges

the batholith An accompanying DVD contains detailed colored maps and chemical isotopic mineralogic and physical  
properties data Provided by publisher      The Tectonic Setting and Origin of Cretaceous Batholiths within the North

present a big picture paradigm busting synthesis that examines the tectonic setting temporal relations and geochemistry of many plutons within Cretaceous batholithic terranes of the North American Cordillera In addition to their compelling tectonic synthesis they argue that most of the batholiths are not products of arc magmatism as commonly believed but instead were formed by slab failure during and after collision They show that slab window and Precambrian TTG suites share many geochemical similarities with Cretaceous slab failure rocks Geochemical and isotopic data indicate that the slab failure magmas were derived dominantly from the mantle and thus have been one of the largest contributors to growth of continental crust The authors also note that slab failure plutons emplaced into the epizone are commonly associated with Cu Au porphyries as well as Li Cs Ta pegmatites
