

# Magellanic clouds

- The Magellanic Clouds are two irregular dwarf galaxies visible from the Southern Hemisphere, orbiting the Milky Way
- They consist of two main types: the Large Magellanic Cloud (LMC) and the Small Magellanic Cloud (SMC)
- These galaxies are important for astronomers because they are close enough to study interactions and star formation processes in detail
- They also play a key role in refining our understanding of the cosmic distance scale

## Practical example: Astronomy

- The Magellanic Clouds are visible in the southern night sky, appearing as two irregular dwarf galaxies orbiting the Milky Way
- Observing these galaxies provides astronomers and enthusiasts insights into galactic formation and evolution
- They're also a crucial part of studying the history of the Milky Way, helping us understand our own galaxy's past and future
- By observing these celestial bodies, we gain valuable knowledge about the universe's vast scale and complexity

Grindlay, A.G. Davis  
Philip, 2012-12-06 In the centennial year 1985 86 of Harlow Shapley's birth the study of globular clusters was no less important to the development of astronomy than in 1915 when Shapley first noted their concentration on the sky By 1917 Shapley had used the properties of the system of globular clusters to complete the Copernican revolution and locate the solar system and its Earth bound observers far from the center of the Galaxy and the globular cluster distribution Seven decades later in the year of these proceedings globular cluster research and the study of the system of globular clusters in our own and distant galaxies is undergoing a renaissance of activity The introduction of new observational tools particularly CCD imagers and digital spectrographs as well as powerful theoretical methods have transformed the study of globular clusters into one of the main line areas of modern astrophysics Thus it seemed particularly appropriate to one of us when considering how the Harvard College Observatory might mark the Shapley centennial to propose and plan for an IAU Symposium on Globular Cluster Systems in Galaxies Planning for the Shapley Symposium as it came to be called was even more drawn out than the preparation of this volume The Symposium was originally proposed to the IAU Secretariat in time for it to be held in August 1985 so that it might occur in the centennial calendar year      Frontiers Of Space And Ground-Based Astronomy  
Willem Wamsteker, Malcolm S. Longair, Y. Kondo, 2012-12-06 ROSAT Observations G HASINGER Max Planck Institut für extraterrestrische Physik D 85740 Garching Germany Abstract This review describes the most recent advances in the study of the extragalactic soft X ray background and what we can learn about its constituents The deepest pointed observations with the ROSAT PSPC are discussed The logN logS relation is presented which reaches to the faintest X ray fluxes and to the highest AGN surface densities ever achieved The N S relation shows a 2 density in excess of 400 deg at the faintest fluxes and a flattening below the Einstein Deep Survey limit About 60% of the extragalactic background has been resolved in the deepest field Detailed source spectra and first optical and radio identifications will be discussed The results are put into perspective of the higher energy X ray background Key words X rays background radiations active galactic nuclei 1  
Introduction The extragalactic X ray background XRB discovered about 30 years ago has been studied extensively with many X ray experiments in particular with the satellites HEAO I and II see e.g. Boldt 1987 and with ROSAT e.g. Hasinger et al 1993

Figure 1 shows a compilation of some of the most recent spectral measurements for the X ray background. Over the energy range from 3 to about 100 keV its spectrum can be well approximated by an optically thin thermal bremsstrahlung model with  $kT = 40$  keV while at lower X ray energies a steepening into a new component has been observed.
