The Embryogenesis of the Human Skull Robert Shapiro, Franklin Robinson, 1980 Rapidly developing diagnostic and therapeutic methods involving direct contact with the human fetus fetoscopy fetal surgery ultrasonic scanning demand a precise knowledge of normal structural development during gestation Toward achieving that goal of precision Drs Robert Shapiro and Franklin Robinson have created an atlas described by Richard L Sidman as a solid piece of research executed with considerable esthetic as well as scholarly finesse and which will serve as the definitive study on an important aspect of human fetal development The authors have documented the early development of the human skull in terms of gross size shape and the behavior of the individual bones comparing the skull with reference to their ossification centers ossification rates and relationships The data are presented in very high quality photographs and radiographs of the dried skull in several relevant orientations low magnification color photomicrographs of well sectioned and stained specimens and color photographs of an unusually fine series of transilluminated skulls prepared by the Spalteholz method Line drawings are also presented to assist in interpretation The atlas is organized according to gestational age and a tabular summary is given of the 63 specimens ranging in age from ten to forty fetal weeks This will be the basic normative standard reference for studies on developmental skeletal disorders of the head and neck it will be useful as well in the study of developmental brain diseases Radiologists engaged in visualizing the fetus and diagnosing fetal diseases in situ by ultrasound computerized tomography and other methods will find this an invaluable tool *Atlas of Neuroradiologic Embryology, Anatomy, and Variants* J.
