

STRUCTURAL MODELLING OF ECONOMIC GROWTH: TECHNOLOGICAL CHANGES

Neoclassical and Keynesian theories of economic growth assume the use of Cobb–Douglas modified functions and other aggregate econometric approaches to growth dynamics modelling. In that case explanations of economic growth are based on the logic of the used mathematical ratios often including the ideas about aggregated values change and factors change a priori. The idea of assessment of factor productivity is the fundamental one among modern theories of economic growth. Nevertheless, structural parameters of economic system, institutions and technological changes are practically not considered within known approaches, though the latter is reflected in the changing parameters of production function. At the same time, on the one hand, the ratio of structural elements determines the future value of the total productivity of the factors and, on the other hand, strongly influences the rate of economic growth and its mode of innovative dynamics. To put structural parameters of economic system into growth models with the possibility of assessment of such modes under conditions of interaction of new and old combinations is an essential step in the development of the theory of economic growth/development. It allows forming stimulation policy of economic growth proceeding from the structural ratios and relations recognized for this economic system. It is most convenient in such models to use logistic functions demonstrating the resource change for old and new combination within the economic system. The result of economy development depends on starting conditions, and on institutional parameters of velocity change of resource borrowing in favour of a new combination and creation of its own resource. Model registration of the resource is carried out through the idea of investments into new and old combinations.

Environmental Sustainability Raghbendra Jha,K.V. Bhanu Murthy,2006-09-27 With globalization fast becoming an irreversible process it is necessary to pay increased attention to the implications for environmental sustainability However the so called environmental Kuznets curve EKC argument implies that rapid economic growth in many developing countries should be environmentally unsustainable Environmental Sustainability addresses this dichotomy and articulates a notion of consumption sustainability that is both universal and pertains to the indefinite future Additionally it emphasizes the importance of addressing a broad spectrum of sources of environmental degradation and relates this measure to an index of economic achievement more complete than per capita income As well as the EKC authors Jha and Murthy also critique the Environmental Sustainability Index ESI and empirically substantiate the proposition that a certain type of development in the presently high income countries is primarily responsible for global environmental degradation Several policy conclusions for global environmental management are also advanced Throughout Jha and Murthy comprehensively evaluate existing approaches to environmental sustainability and critically review empirical studies of environmental degradation and economic development making this an invaluable source of information for those concerned with environmental economics and political economy

Employment Impacts of Cleaner Production Klaus Rennings, Thomas Zwick, 2012-12-06 This book covers a highly relevant but clearly under researched topic the impact of environmental innovations on employment on the firm level While the impact of innovations on employment has been analysed empirically in several studies only few studies have specifically analysed innovations which are environmentally beneficial In this book we present case studies and an in depth analysis of the behaviour of more than 1 500 firms that have recently introduced environmental innovations in five European countries Germany United Kingdom Italy the Netherlands Switzerland The data stem from identical telephone interviews carried out simultaneously in these countries The interviews were especially designed for analysing the relationship between environmental innovation and employment on the firm level On the basis of an econometric model we find which factors lead to positive and which factors lead to negative employment effects in the wake of environmental

innovations Product and service innovations create more jobs in contrast to process innovations Employment changes only occur in the wake of major innovations When innovations are mainly motivated by environmental concerns they tend not to have employment effects Eco innovations aiming at cost reduction reduce employment If the innovation is motivated by market share considerations employment may change in both directions We detect skill biased technological change of eco innovations because the share of highly qualified employees has a positive impact on employment increases while it is insignificant for employment decreases
