50 years after the perceptron, 25 years after PDP: Neural

computation in language sciences Julien Mayor, Pablo Gomez, Franklin Chang, Gary Lupyan, 2014-08-11 This Research Topic aims to showcase the state of the art in language research while celebrating the 25th anniversary of the tremendously influential work of the PDP group and the 50th anniversary of the perceptron. Although PDP models are often the gold standard to which new models are compared, the scope of this Research Topic is not constrained to connectionist models. Instead, we aimed to create a landmark forum in which experts in the field define the state of the art and future directions of the psychological processes underlying language learning and use broadly defined. We thus called for papers involving computational modeling and original research as well as technical, philosophical or historical discussions pertaining to models of cognition. We especially encouraged submissions aimed at contrasting different computational frameworks and their relationship to imaging and behavioral data.

Language and Concept Acquisition from Infancy Through Childhood Jane B. Childers, 2020-02-03 This book examines the role of experience based learning on children's acquisition of language and concepts. It reviews, compares and contrasts accounts of how the opportunity to recognize and generalize patterns influences learning. The book offers the first systematic integration of three highly influential research traditions in the domains of language and concept acquisition: Statistical Learning, Structural Alignment and the Bayesian learning perspective. Chapters examine the parameters that constrain learning, address conditions that optimize learning and offer explanations for cases in which implicit exemplar based learning fails to occur. By exploring both the benefits and challenges children face as they learn from multiple examples, the book offers insight on how to better understand children's early unsupervised learning about language and concepts. Topics featured in this book include: Competing models of statistical learning and how learning might be constrained by infants' developing cognitive abilities; How experience with multiple exemplars helps infants understand space and other relations; The emergence of category based inductive reasoning during infancy and early childhood; How children learn individual verbs and the verb system over time; How statistical learning leads to aggregation and abstraction in word learning; Mechanisms for evaluating others' reliability as sources of knowledge when learning new words; The Search for Invariance (SI) hypothesis and its role in facilitating causal learning. *Language and Concept Acquisition from Infancy Through Childhood* is an essential resource for researchers, clinicians and related professionals and graduate students in infancy and early child development, applied linguistics, language education, child school and developmental psychology and related mental health and education services.
