Structure Properties Of Materials Volume 4:

Structural Concrete Textbook, Volume 5 fib Fédération internationale du béton, 2012-06-01 The third edition of the Structural Concrete Textbook is an extensive revision that reflects advances in knowledge and technology over the past decade. It was prepared in the intermediate period from the CEP FIP Model Code 1990 MC90 to fib Model Code for Concrete Structures 2010 MC2010 and as such incorporates a significant amount of information that has been already finalized for MC2010 while keeping some material from MC90 that was not yet modified considerably. The objective of the textbook is to give detailed information on a wide range of concrete engineering from selection of appropriate structural system and also materials through design and execution and finally behaviour in use. The revised fib Structural Concrete Textbook covers the following main topics: phases of design process, conceptual design, short and long term properties of conventional concrete including creep, shrinkage, fatigue and temperature influences, special types of concretes such as self-compacting concrete, architectural concrete, fibre reinforced concrete, high and ultra high performance concrete, properties of reinforcing and prestressing materials, bond, tension stiffening, moment curvature, confining effect, dowel action, aggregate interlock, structural analysis with or without time dependent effects, definition of limit states, control of cracking and deformations, design for moment, shear or torsion, buckling, fatigue, anchorages, splices, detailing, design for durability including service life, design aspects, deterioration mechanisms, modelling of deterioration mechanisms, environmental influences, influences of design and execution on durability, fire design including changes in material and structural properties, spalling, degree of deterioration, member design, linear members and slabs with reinforcement layout, deep beams, management, assessment, maintenance, repair including conservation strategies, risk management, types of interventions as well as aspects of execution, quality assurance, formwork and curing. The updated textbook provides the basics of material and structural behaviour and the fundamental knowledge needed for the design, assessment or retrofitting of concrete structures. It will be essential reading material for graduate students in the field of structural concrete and also assist designers and consultants in understanding the background to the rules they apply in their practice. Furthermore, it should prove particularly valuable to users of the new editions of Eurocode 2 for concrete buildings, bridges and container structures which are based only partly on MC90 and partly on more recent knowledge which was not included in the 1999 edition of the textbook.

Ferroelectrics Mickaël Lallart, 2011-08-23 Ferroelectric materials have been and still are widely used in many applications that have moved from sonar towards breakthrough technologies such as memories or optical devices. This book is a part of a four volume collection covering material aspects, physical effects, characterization and modeling and applications and focuses on the characterization of ferroelectric materials including structural, electrical and multiphysics aspects as well as innovative techniques for modeling and predicting the performance of these devices using phenomenological approaches and nonlinear methods. Hence the aim of this book is to provide an up to date review of recent scientific findings and recent advances in the

field of ferroelectric system characterization and modeling allowing a deep understanding of ferroelectricity
