Biochemistry and Molecular Biology of Wood Takayoshi Higuchi, 2012-12-06 Progress in wood chemistry has been related mainly to chemical wood pulping and bleaching and chemical utilization of wood and wood extractives Methods of wood analysis were developed by Schorger proximate analysis in 1917 and Dore summative analysis in 1919 and standard methods based on Schorger's method e.g TAPPI standards Technical Association of the Pulp and Paper Industry have been widely used for chemical analysis of woods in many countries Thus it is generally known that wood is composed of about 50% cellulose 20-35% of lignin 15-25% of hemicelluloses and variable amounts of extractives Chemical characterization and efficient utilization of these wood components have been studied in laboratories of wood chemistry and technology in universities and government institutions In the last decade biochemistry and molecular biology of microorganisms animals and plants have greatly progressed At the same time wood has been recognized as a unique renewable ecomaterial produced by trees using solar energy In addition many desirable properties of wood and wood components as biomaterial that affects physiology and psychology in humans have recently attracted attention

Advances in Seed Biology Paolo A. Sabelli, Brian A. Larkins, 2015-11-11 The seed plays a fundamental role in plant reproduction as well as a key source of energy nutrients and raw materials for developing and sustaining humanity With an expanding and generally more affluent world population projected to reach nine billion by mid century coupled to diminishing availability of inputs agriculture is facing increasing challenges to ensure sufficient grain production A deeper understanding of seed development evolution and physiology will undoubtedly provide a fundamental basis to improve plant breeding practices and ultimately crop yields Recent advances in genetic biochemical molecular and physiological research mostly brought about by

the deployment of novel high throughput and high sensitivity technologies have begun to uncover and connect the molecular networks that control and integrate different aspects of seed development and help determine the economic value of grain crops with unprecedented details The objective of this e book is to provide a compilation of original research articles reviews hypotheses and perspectives that have recently been published in Frontiers in Plant Science Plant Evolution and Development as part of the Research Topic entitled Advances in Seed Biology Editing this Research Topic has been an extremely interesting educational and rewarding experience and we sincerely thank all authors who contributed their expertise and in depth knowledge of the different topics discussed We hope that the information presented here will help to establish the state of the art of this field and will convey how exciting and important studying seeds is and hopefully will stimulate a new crop of scientists devoted to investigating the biology of seeds

Annual Plant Reviews, Plant Cell Separation and Adhesion Jeremy A. Roberts, Zinnia Gonzalez-Carranza, 2008-04-15

Cell separation is an important process that occurs throughout the life cycle of a plant It enables the radicle to emerge from the germinating seed vascular tissue to differentiate sculpturing of leaves and flowers to take place pollen to be shed from the mature anther fruit to soften senescent and non functional organs to be lost and seeds to be shed In addition to its intrinsic scientific interest many of the developmental processes to which it contributes have importance for agriculture and horticulture This is the first volume to focus exclusively on these processes and to link improvements in our scientific understanding with methods that may allow us to manipulate cell separation and adhesion to the benefit of the agricultural and horticultural industries It will therefore be of interest to the experimental scientist and to those who wish to apply these techniques commercially
