Student Motivation Farideh Salili, Chi-yue Chiu, Ying-yi Hong, 2012-12-06 Ever since the advent of the intelligence test we have thought of exceptional achievement in terms of cognitive attributes We have words and phrases like genius above average intelligence average and mentally deficient to describe different levels of cognitive ability In the United States widespread use of intelligence tests followed the success of the in World War I and for the next half century Army Alpha and Beta Tests intelligence tests were the major measures used to predict school and vocational achievement Learning was primarily studied in laboratories and the behaviorist theories that were dominant largely dealt with changes in overt behavior As a result there was relatively little influence of learning research on concepts involving cognition and intelligence The transition from behaviorism to cognitive psychology that began in the 1940 s and 50 s came into full flower in the 1970 s and 80 s and great progress was made in understanding learning memory and thinking In the decades following World War I there had been many debates about the possible influence of environmental conditions on intelligence but the cognitive abilities measured by intelligence tests were generally believed to be determined by heredity The intelligence tests of cognitive abilities correlated substantially with academic performance so their use in determining which students needed special help in school or which students were capable of university work was widely accepted As cognitive psychology became dominant
