

The East Point and the Antivertex

Maritha Pottenger

1983

ASTRONOMICAL BACKGROUND

The angles of a horoscope are based on the intersection points of great circles. A great circle is the largest circle it is possible cut through a sphere, that is, the circle with the greatest radius. All great circles go through the center of the sphere. (Small circles do not pass through the center of the sphere.)

One familiar great circle on Earth is the Equator. That is the circle going around the middle of the Earth which is equally distant from both the north and south poles. Latitude on the Earth is measured north or south of the Equator and parallels of latitude (imaginary lines we visualize on the Earth and draw on our maps) are all small circles parallel to the Equator.

Astronomy (and astrology) work with a number of great circles on the "celestial sphere". (The celestial sphere is an imaginary sphere centered on the Earth. Everything in the sky is assumed to be on the surface of this sphere for convenience in measurements and calculations.) The ecliptic is one such great circle. The ecliptic is the Earth's path around the Sun. (From our vantage point, it is the apparent path of the Sun around the Earth. We know, of course, that the Earth revolves around the Sun, but it appears that the Sun revolves around the Earth.) Another common great circle is the horizon. Most people refer to the place where earth meets sky as the horizon. This is the visible or apparent horizon. It is a small circle because it does not go through the center of the Earth. If we take the four cardinal points of a compass (north, east, south and west) and connect them in a circle, parallel to the visible horizon but through the center of Earth, we have created the great circle that is the rational horizon. The poles of
