Awakening and Sleep-wake Cycle Across Development Piero Salzarulo, Gianluca Ficca, 2002-01-01 Sleep and wakefulness undergo important changes with age Awakening a crucial event in the sleep wake rhythm is a transition implying complex physiological mechanisms Its involvement in sleep disturbances is also well known This collective volume is the first attempt to systematically approach awakening across development A methodological section considers criteria to define awakening in a developmental perspective Theoretical considerations on development of wakefulness and on its relation to consciousness are included and provide a vigorous impulse to go beyond present criteria and classifications Age changes are the core of studies on development a section of the book examines old and new data from preterm to infants up to children underscoring the main turning points along this developmental path As for other aspects of development awakening and the sleep wake cycle are also influenced by external factors both physical and human Several contributions deal with this topic in particular focusing on the parent infant interaction and the influences of culture Clinical contexts offer an opportunity to show both quantitative and qualitative changes of awakening and arousals in different pathological conditions Either partial changes of one physiological variable or global and massive changes can be observed

Optogenetic Reverse-engineering of Brain Sleep/wake Circuitry Matthew Evan Carter, 2011 The neural control of sleep and wakefulness depends upon a complex and partially defined balance between subcortical excitatory and inhibitory populations in the brain Wake active neurons include hypocretin Hcrt containing neurons in the lateral hypothalamus and noradrenergic neurons that make up the brainstem locus coeruleus LC Experimentally determining a causal role for these neurons in promoting and maintaining wakefulness has remained elusive using traditional pharmacological and electrical techniques due to their small size unique morphology and proximity to heterogeneous neuronal and non neuronal cell types The recent development of optogenetic technology provides a toolkit of genetically encodable millisecond timescale stimulation and inhibition probes that can be targeted to specific cell types with no toxicity to the cells under investigation This dissertation discusses the application of optogenetic tools to questions about sleep wake circuitry and uses these tools to study Hcrt and LC neurons both individually and in combination
