Super-Intelligent Machines Bill Hibbard, 2002-10-31 Table of contents [Super-Intelligent Machines](#) Bill Hibbard, 2012-12-06 Super Intelligent Machines combines neuroscience and computer science to analyze future intelligent machines. It describes how they will mimic the learning structures of human brains to serve billions of people via the network and the superior level of consciousness this will give them. Whereas human learning is reinforced by self interests, this book describes the selfless and compassionate values that must drive machine learning in order to protect human society. Technology will change life much more in the twenty first century than it has in the twentieth, and Super Intelligent Machines explains how that can be an advantage.

Digital Soul Thomas Georges, 2004-10-13 Should the day come when intelligent machines not only make computations but also think and experience emotions as humans do, how will we distinguish the human from the machine? This introduction to artificial intelligence and to its potentially profound social, moral, and ethical implications is designed for readers with little or no technical background. In accessible, focused, engaging discussions, physicist and award-winning science writer Thomas Georges explores the fundamental issues: What is consciousness? Can computers be conscious? If machines could think and even feel, would they then be entitled to human rights? Will machines and people merge into a biomechanical race? Should we worry that super intelligent machines might take over the world? Even now we continue to put increasingly sophisticated machines in control of critical aspects of our lives in ways that may hold unforeseen consequences for the human race. Digital Soul challenges all of us before it's too late to think carefully and rationally about the kind of world we will want to live in with intelligent machines ever closer by our sides.

Machine Ethics Michael Anderson, Susan Leigh Anderson, 2011-05-09 The new field of machine ethics is concerned with giving machines ethical principles or a procedure for discovering a way to resolve the ethical dilemmas they might encounter, enabling them to function in an ethically responsible manner through their own ethical decision making. Developing ethics for machines, in contrast to developing ethics for human beings who use machines, is by its nature an interdisciplinary endeavor. The essays in this volume represent the first steps by philosophers and artificial intelligence researchers toward explaining why it is necessary to add an ethical dimension to machines that function autonomously, what is required in order to add this dimension, philosophical and practical challenges to the machine ethics project, various approaches that could be considered in attempting to add an ethical dimension to machines, work that has been done to date in implementing these approaches, and visions of the future of machine ethics research.

INTELLIGENCE OF MACHINES Patrick K. Kalifungwa,2024-11-13 In a 1951 lecture Turing Alan 1951 Turing argued It seems probable that once the machine thinking method had started it would not take long to outstrip our feeble powers There would be no question of the machines dying and they would be able to converse with each other to sharpen their wits At some stage therefore we should have to expect the machines to take control in the way that is mentioned in Samuel Butler's Erewhon Also in a lecture broadcast on the BBC Turing Alan 1951 He expressed the opinion If a machine can think it might think more intelligently than we do and then where should we be Even if we could keep the machines in a subservient position for instance by turning off the power at strategic moments we should as a species feel greatly humbled This new danger is certainly something which can give us anxiety as interpreted by Seth Baum Hubert Dreyfus writes In general by accepting the fundamental assumptions that the nervous system is part of the physical world and that all physical processes can be described in a mathematical formalism which can in turn be manipulated by a digital computer one can arrive at the strong claim that the behavior which results from human information processing whether directly formalizable or not can always be indirectly reproduced on a digital machine Dreyfus 1972 John Searle writes Could a man made machine think Assuming it possible produce artificially a machine with a nervous system the answer to the question seems to be obviously yes Could a digital computer think If by digital computer you mean anything at all that has a level of description where it can be correctly described as the instantiation of a computer program then again the answer is of course yes since we are the instantiations of any number of computer programs and we can think Searle 1980 **Machines Behaving Badly** Toby
