Surface Level Ozone Exposures And Their Effects On Vegetation:

Surface-Level Ozone Exposures and Their Effects on Vegetation Allen S. Lefohn, 1991-12-18 Tropospheric ozone is a regionally distributed air pollutant that adversely affects both humans and vegetation. *Surface Level Ozone Exposures and Their Effects on Vegetation* focuses on the formation, distribution, and transport of surface level ozone, the characterization of its exposures, the mechanisms and processes involved in its deposition and uptake by plants, and its effects on the growth of crops and forest trees. State-of-the-art information is presented, and the methodology for studying its effects on vegetation is critically reviewed. This background material leads to a discussion of the approaches for developing an air quality standard that will provide protection from the adverse effects of ozone, as well as suggestions for future research directions. Researchers and professionals in the utility industry, oil industry, and government environmental agencies, university instructors, and students will find that this book is filled with information that can be used on a daily basis in their work and studies.

Impact of Air Pollutants on Southern Pine Forests Susan Fox, Robert A. Mickler, 2012-12-06 The public's attitude toward air pollution in the United States evolved substantially during the 1960s. One of the results of the nation's emerging environmental ethic was the creation of the U.S. Environmental Protection Agency (EPA) in December of 1970. Prior to this time, research was focused on the impacts of air pollution on human health and welfare and was largely conducted by several federal research agencies which included the Department of Health, Education, and Welfare, the National Oceanic and Atmospheric Administration, and the U.S. Department of Agriculture. After the creation of the EPA, much of this work was consolidated in one regulatory agency, which resulted in periodic evaluations of the various effects of atmospheric pollution on human health, materials, agriculture, and forest ecosystems. At the same time that environmental interest was growing in the United States, concern increased in the European scientific community and public over the ecological impacts of acidic deposition. As the magnitude of the damage to European lakes and streams and the widespread decline in Norway spruce and silver fir was reported, concern that similar problems were occurring in the United States increased substantially. This concern was heightened by press reports of high elevation spruce-fir forest declines in the Adirondack and Appalachian Mountains and the decline and death of sugar maples in the northeastern United States and Canada.

Production Practices and Quality Assessment of Food Crops Ramdane Dris, S. Mohan Jain, 2007-05-08 Today in a world with abundant food, more than 700 million people are chronically undernourished.

Over the next 20 years the world's population will probably double. The global food supply would need to double or to triple for the larger population to be fed adequately. Agriculture is closely linked to environmental quality in a variety of ways and the challenge of our generation is how to feed a growing planet while maintaining the integrity of our ecological life support system. The responsibility of governments for ensuring food security will grow proportionately with the growth of populations and governments bear a special responsibility for promoting agricultural inputs. Agriculture in the 21st century will certainly focus increasingly on adapting modern technologies to local farming systems needs and environments. Worldwide climatic changes have been raising concerns about potential changes to crop yields and production systems. Such concerns include the ability to accommodate these uncertain effects in order to ensure an adequate food supply for an increasing population. What can be done concretely to use agriculture to address some of the fundamental issues of today's world? We must recognize that agriculture is part of the solution and not just a problem. Agricultural development is a key to social stability and equity in many parts of the world. It can help to alleviate the subtle and unspoken fears of modernization and the space of change if innovation is handled transparently.

Trace Gas Exchange in Forest Ecosystems R. Gasche, H. Papen, H. Rennenberg, 2013-03-14. This volume summarizes the current knowledge on the exchange of trace gases between forests and the atmosphere with the restriction that exclusively carbon and nitrogen compounds are included. For this purpose the volume brings together and interconnects knowledge from different disciplines of biological and atmospheric sciences. It covers microbial and plant processes involved in the production and consumption of these trace gases, the exchange processes between forest soils and vegetation on the one hand and the atmosphere on the other hand, the fate of the trace gases exchanged inside the atmosphere as well as environmental influences on the exchange of trace gases between forest ecosystems and the atmosphere. With this interdisciplinary approach the volume provides the background for an evaluation of the exchange of trace gases between forest ecosystems and the atmosphere and man-made disturbances of this exchange.

Forest Growth Responses to the Pollution Climate of the 21st Century Lucy J. Sheppard, J. Neil Cape, 2013-03-09. This Special Issue of *Water, Air, and Soil Pollution* offers contributions from the 18th IUFRO workshop on Air Pollution Stress: Forest Responses to the Pollution Climate of the 21st Century held in Edinburgh, Scotland, from September 21 to 23, 1998. The meeting was held under the auspices of IUFRO Research Group 7.04.00, chaired by Dr. Kevin Percy of Canada. A new session structure was adopted to stimulate activity within the six working parties and a brief resume of these is presented at the front of this volume. The two one-day plenary sessions were devoted to the two important air pollution issues: nitrogen deposition and ozone. Invited papers were augmented by a large and excellent contribution of poster papers. The final day comprised parallel Working Party Sessions with pre-arranged speakers to stimulate discussions. One hundred and thirty-one scientists attended representing 20 countries and 7 IUFRO regions: Northern Europe, Central Europe, Eastern Europe,

Oxidant Air Pollution Impacts in the Montane Forests of Southern California Paul R. Miller, Joe R. McBride, 2012-12-06 Since the 1950s the pines native to the San Bernardino Mountains in Southern California have shown symptoms of decline that have proven to result from exposure to ozone a major plant damaging gas in photochemical oxidant air pollution Because of their proximity to major urban areas the San Bernardino Mountains have served as a natural laboratory for studying effects of oxidant and acidic air pollution on a mixed conifer forest This volume presents a body of research conducted over more than thirty years including an intensive interdisciplinary five year study begun in 1991 Chapters include studies of the relationships of biogeography and climate to the region's air pollution the chemical and physiological mechanisms of ozone injury as well as the impacts of nitrogen containing pollutants and natural stresses on polluted forests The synthesis of such long term studies provides insights into the combined influences of pollutants on ecosystem function in forested regions with Mediterranean type climates

The Productivity and Sustainability of Southern Forest Ecosystems in a Changing Environment Robert Mickler, Susan Fox, 2012-12-06 In conclusion current year first flush foliage of branches grown in 525 d 1 1 and 700 J Lll I of carbon dioxide had much greater rates of P_{max} compared to the P_{max} of foliage grown in 350 J Lll I carbon dioxide These findings are similar to other long term field studies with loblolly pine Teskey 1995 Murthy 1995 Elevated carbon dioxide concentration was also significantly affected the G_{max} however higher rates were only found at the 525 J Ll 1 I carbon dioxide concentration Generally the total chlorophyll content decreased as the carbon dioxide concentration was increased The data presented here represent first year responses to the carbon dioxide and cultural treatments This experiment will continue to determine whether increased maximum net photosynthetic rate resulting from elevated carbon dioxide will persist over the life of the foliage and over an anticipated greater range of moisture and nutrient availability than existed during the first year of the study In addition to this determination evidence will also be collected to test for the possibility of downward acclimation of photosynthesis by foliage exposed to long term elevated carbon dioxide concentrations Detailed phenology measurements of branches and whole trees are expected to further the knowledge of how loblolly pine trees growing at the edge of the natural range respond to variations in carbon dioxide concentration water and nutrient supply

Air Pollution and Plant Biotechnology K. Omasa, H. Saji, S. Youssefian, N. Kondo, 2012-12-06 Air pollution is ubiquitous in industrialized societies causing a host of environmental problems It is thus essential to monitor and reduce pollution levels A number of plant species already are being exploited as detectors for phytomonitoring and as scavengers for phytoremediation of air pollutants

With advances in biotechnology it is now feasible to modify plants for a wider range of phytomonitoring and phytoremediation applications Air Pollution and Plant Biotechnology presents recent results in this field including plant responses during phytomonitoring pollution resistant plant species imaging diagnosis of plant responses and the use of novel transgenic plants along with reviews of basic plant physiology and biochemistry where appropriate Researchers and students working in plant biotechnology and the environmental sciences or considering new areas of investigation will find this volume a valuable reference
