Since the discovery of high temperature superconductors many new materials have been invented. In the last year several new materials were also discovered but their critical temperatures are still below 100K. Precise physical and chemical work has made tremendous progress in the theoretical and experimental study of physical properties and carrier state characterizations. The de Haas van Alphen effect measurement showed the existence of a Fermi surface in YBCO. Flux dynamics is a well known new problem in which flux creep and irreversibility line features are especially important for a fundamental understanding of the critical current and flux pinning. Flux pinning centers which are intentionally added using non superconducting precipitates, neutrons and protons etc. increase critical currents to practical levels. The analysis of electric and magnetic properties are expected to reveal the pinning mechanism and also to further application development. As for wires and bulks many melt like sintering techniques have improved the material performance of critical current densities. A new seeding Quench Melt Growth technique enlarged crystal size and increased the repulsion force. These melting processes in conjunction with a mechanical strength improvement have been effectively introduced into wire fabrication in order to realize kilometer range wires and will put the oxide wires to practical use. Where thin film is concerned when many fabrication methods had been developed using the assistance effect of activated oxygen such as ozone and oxygen radicals a high current density of 106A/cm at 77K was reported.

**Advances in Superconductivity IV** Hisao Hayakawa, Naoki Koshizuka, 2012-12-06

Five years have passed since the breakthrough in the critical temperature for superconductors. During this period many superconducting materials have been discovered and developed and our knowledge of the physical and other properties of oxide superconductors has deepened through extensive and intensive research. This knowledge has advanced superconductivity science and technology from the initial questioning stage to a more developed but still uncertain second stage where research activity in superconductivity now overlaps with fields of application. Generally speaking science resonates with technology. Science not only complements but also competes with or stimulates technology. New scientific knowledge has triggered the second technological research stage. Much progress has been made in the development of practical devices encouraging the application of superconductors in areas such as human levitation, a high speed levitated bearing, large current transforming leads and high frequency devices. This technological progress has increased our understanding of the science involved such as flux pinning and dynamics and anomalous long range superconducting interactions. At this important stage international cooperation and collaborative projects can effectively sustain aggressive research and development in order to advance superconductivity to the next stages. The ISS Symposium is expected to serve as a venue for increasing our knowledge of superconductivity and for exchanging visions for future research and applications through the presentation and discussion of the latest research results. These proceedings also
