Myeloid Derived Suppressor Cells as Disease

Modulators Olivera J. Finn, Augusto C. Ochoa, 2020-05-06 Myeloid Derived Suppressor Cells MDSCs are a heterogeneous population of immature myeloid cells that can suppress the function of multiple immune cells and in particular T cells through various mechanisms MDSCs can be divided into two major subtypes based on their cell surface phenotype and morphology polymorphonuclear MDSC PMN MDSC or G MDSC and monocytic MDSC M MDSC Additional subtypes have been proposed such as the early MDSC e MDSC that lack both macrophage and granulocyte markers There is still considerable ambiguity about the phenotype of these cells that corresponds to their immunosuppressive function and there are on going challenges on how to identify purify and or potentially generate and expand these cells in vitro MDSCs were first discovered in cancer patients where they have been most extensively studied as components of the immunosuppressive tumor microenvironment In the last several years however the importance of their immunomodulatory role in many other disease and clinical settings has emerged Acknowledgments We acknowledge the initiation and support of this Research Topic by the International Union of Immunological Societies IUIS We hereby state publicly that the IUIS has had no editorial input in articles included in this Research Topic thus ensuring that all aspects of this Research Topic are evaluated objectively unbiased by any specific policy or opinion of the IUIS

Suppressor Cells and Their Factors Randall S. Krakauer, 2018-01-18 It has only been a short time since the existence of suppressor cells was demonstrated yet in this period of time a great deal of information has been compiled concerning their basic science and their functions or disordered functions in human disease This volume is an attempt to clarify the immune mechanisms through which these cells act their normal functions and how their functions are disordered in certain disease states In this volume some rational approaches are proposed to therapy of diseases perceived at least partially due to disordered immune regulation Particular focus is on the recently emerging field of soluble suppressor factors as a means of providing adoptive immunotherapy in certain situations I hope that future work in this field will justify the confidence in this approach

Damage-Associated Molecular Patterns in Human Diseases Walter Gottlieb Land, 2018-10-09 This book presents current understanding of the importance of modern immunology in the etiopathogenesis of human diseases and explores how this understanding is impacting on diagnosis prognosis treatment and prophylaxis As the core of modern immunology the danger injury model is introduced and addressed throughout the book Volume I of the book describes the network of damage associated molecular pattern molecules DAMPs and examines the central role of DAMPs in cellular stress responses and associated regulated cell death the promotion and resolution of inflammation the activation of innate lymphoid

cells and unconventional T cells the stimulation of adaptive immunity and tissue repair The significance of DAMPs in a wide range of human diseases will then be explored in Volume II of the book with discussion of the implications of injury induced innate immunity for present and future treatments This book is written for professionals from all medical and paramedical disciplines who are interested in the introduction of innovative data from immunity and inflammation research into clinical practice The readership will include practitioners and clinicians such as hematologists rheumatologists traumatologists oncologists intensive care anesthetists endocrinologists such as diabetologists psychiatrists neurologists pharmacists and transplantologists Immunogenetic Risk Assessment In Human Disease J.
